B. AMLSG

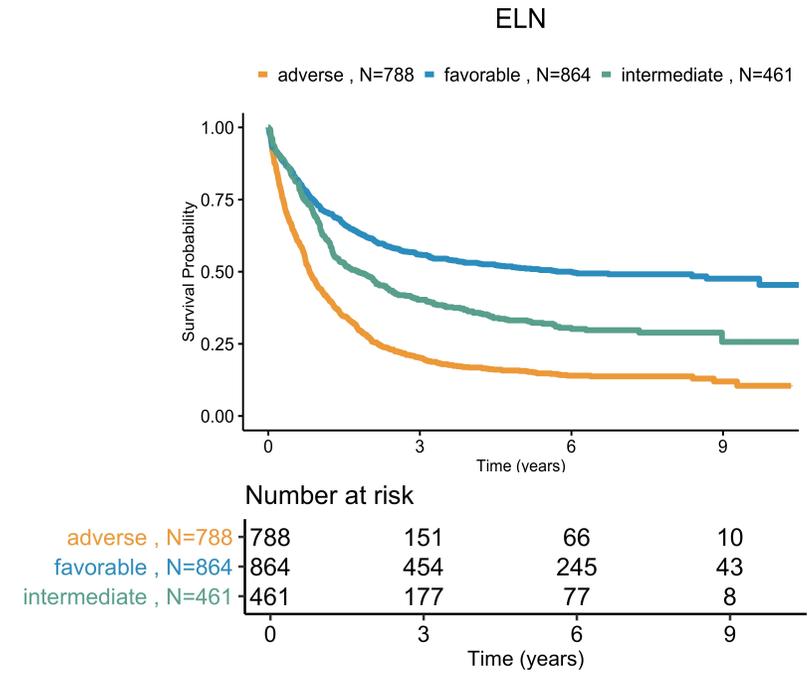

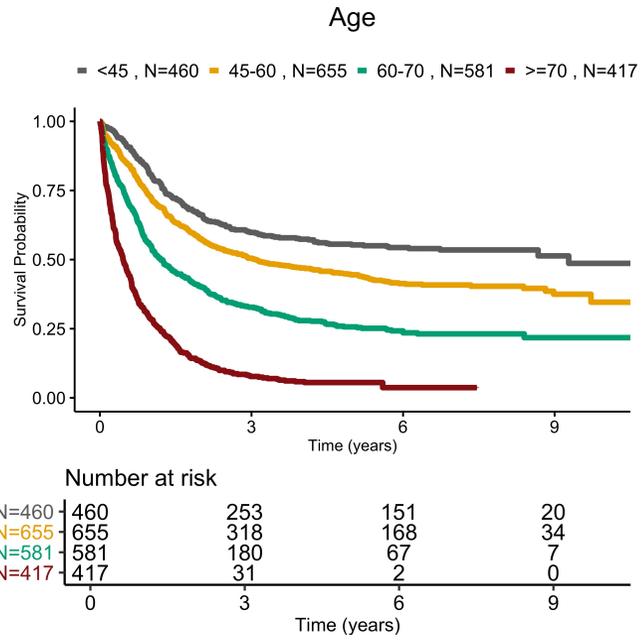

S. Figure 2: Molecular characteristics. Distribution of gene mutations and cytogenetic abnormalities in A. AML NCRI trial study set (2,113 patients and 8,460 driver events) and B. AML SG study set (1,540 patients and 5,043 driver events).

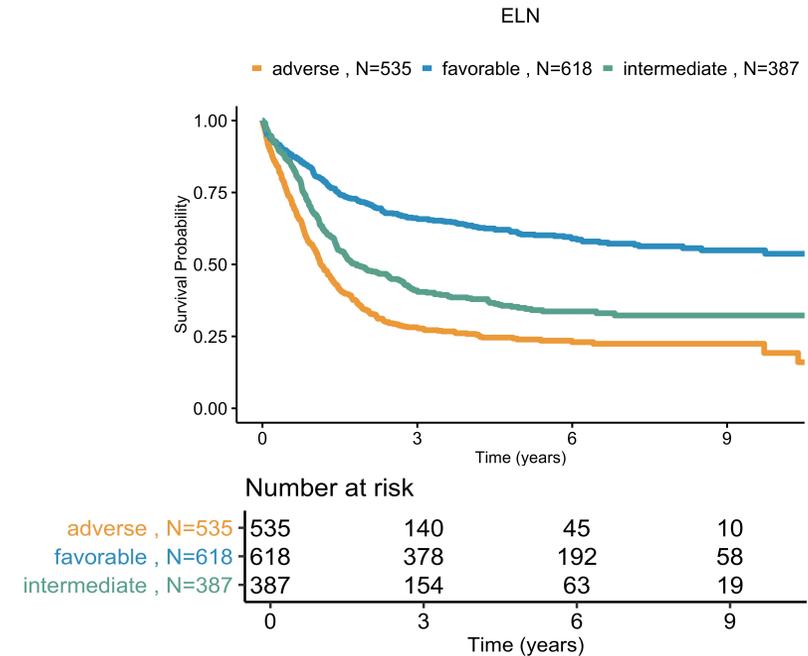

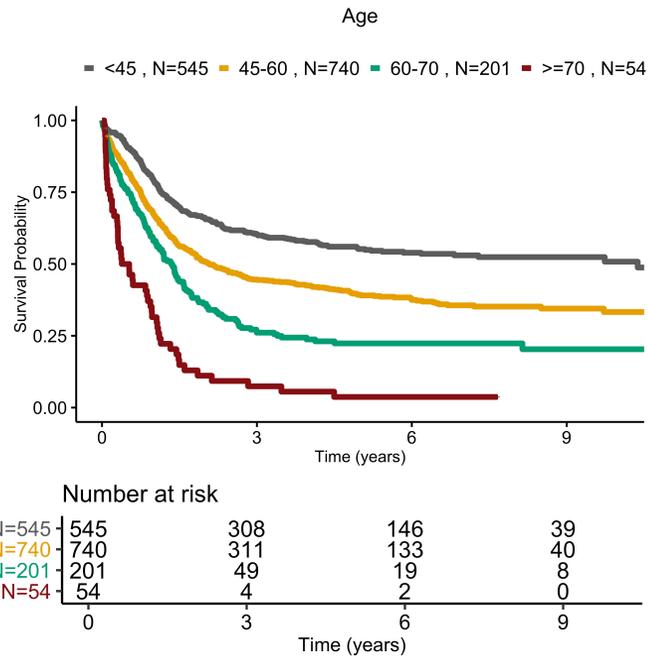

S. Figure 3: Age and ELN²⁰¹⁷ relationships to survival. Kaplan-Meier curves for overall survival by age and ELN²⁰¹⁷ stratification in A. NCRI trial study set (n=2,113) and B. AMLSG study set (n=1,540).

A. UK AML NCRI

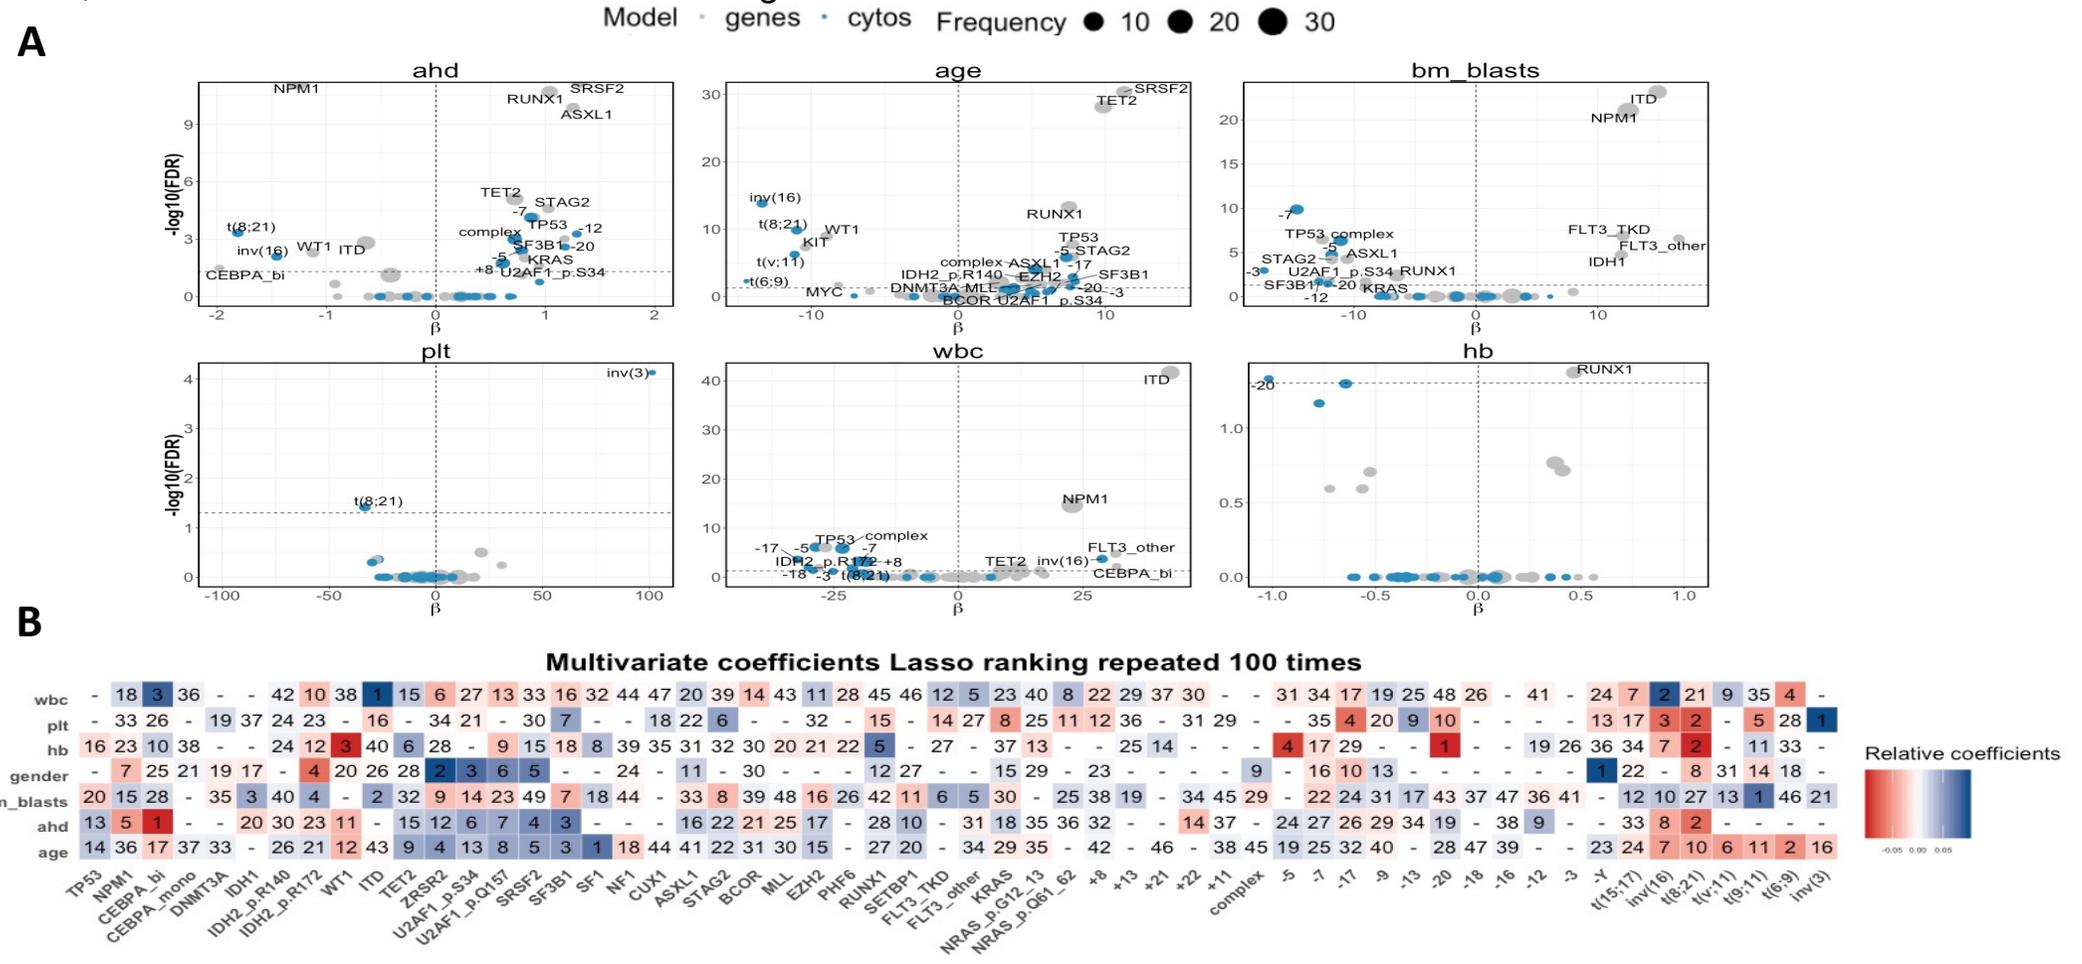

B. AMLSG

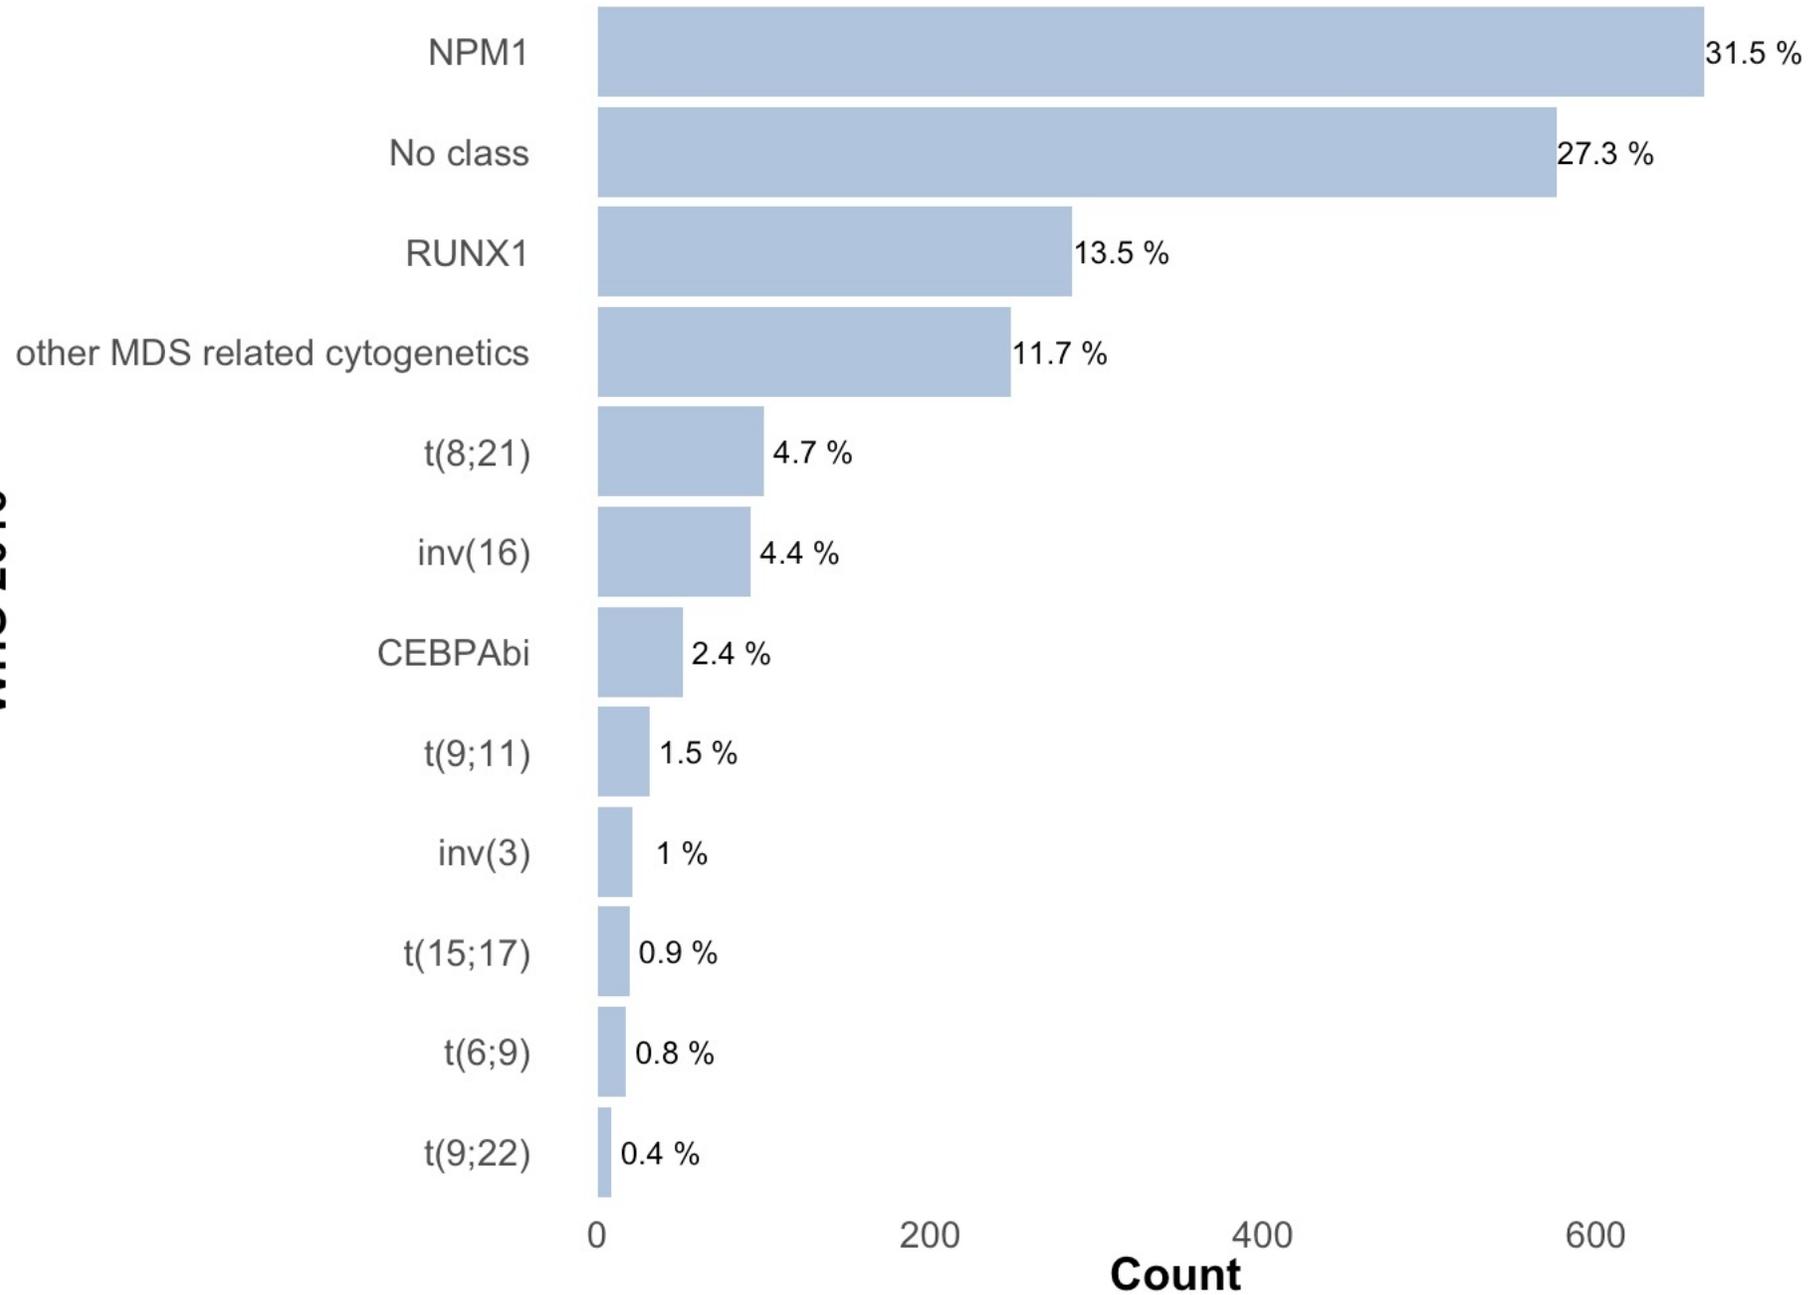

S.Figure 4: Molecular predictors of clinical correlates. A. Volcano plots for univariate regression analysis for each clinical parameter (Antecedent hematologic disorder, Age, Bone marrow blasts, Platelets, White blood cell counts and hemoglobin) in NCRI trial study set (n= 2,113). Genes are colour coded in blue, whilst cytogenetic events in grey. The size of each point corresponds to the frequency of the event. The horizontal dotted curve corresponds to the p-value threshold of 0.05 (on the y-axis) and the vertical one corresponds to $\beta=0$ (x axis). Significant predictors are highlighted (p-value less than 0.05).

B. Multivariate regression ranking of clinical correlates in NCRI trial study set (n= 2,113). The numbers correspond to the ranking of the absolute value of the β coefficients while the colour intensities represent the absolute coefficient values ranking (red with high intensity for largest negative value and blue with high intensity for largest positive value). The regression process is explained in S.Appendix. Abbreviations: ahd refers to antecedent hematologic disorder, plt to platelet, wbc to white blood cells and hb to hemoglobin.

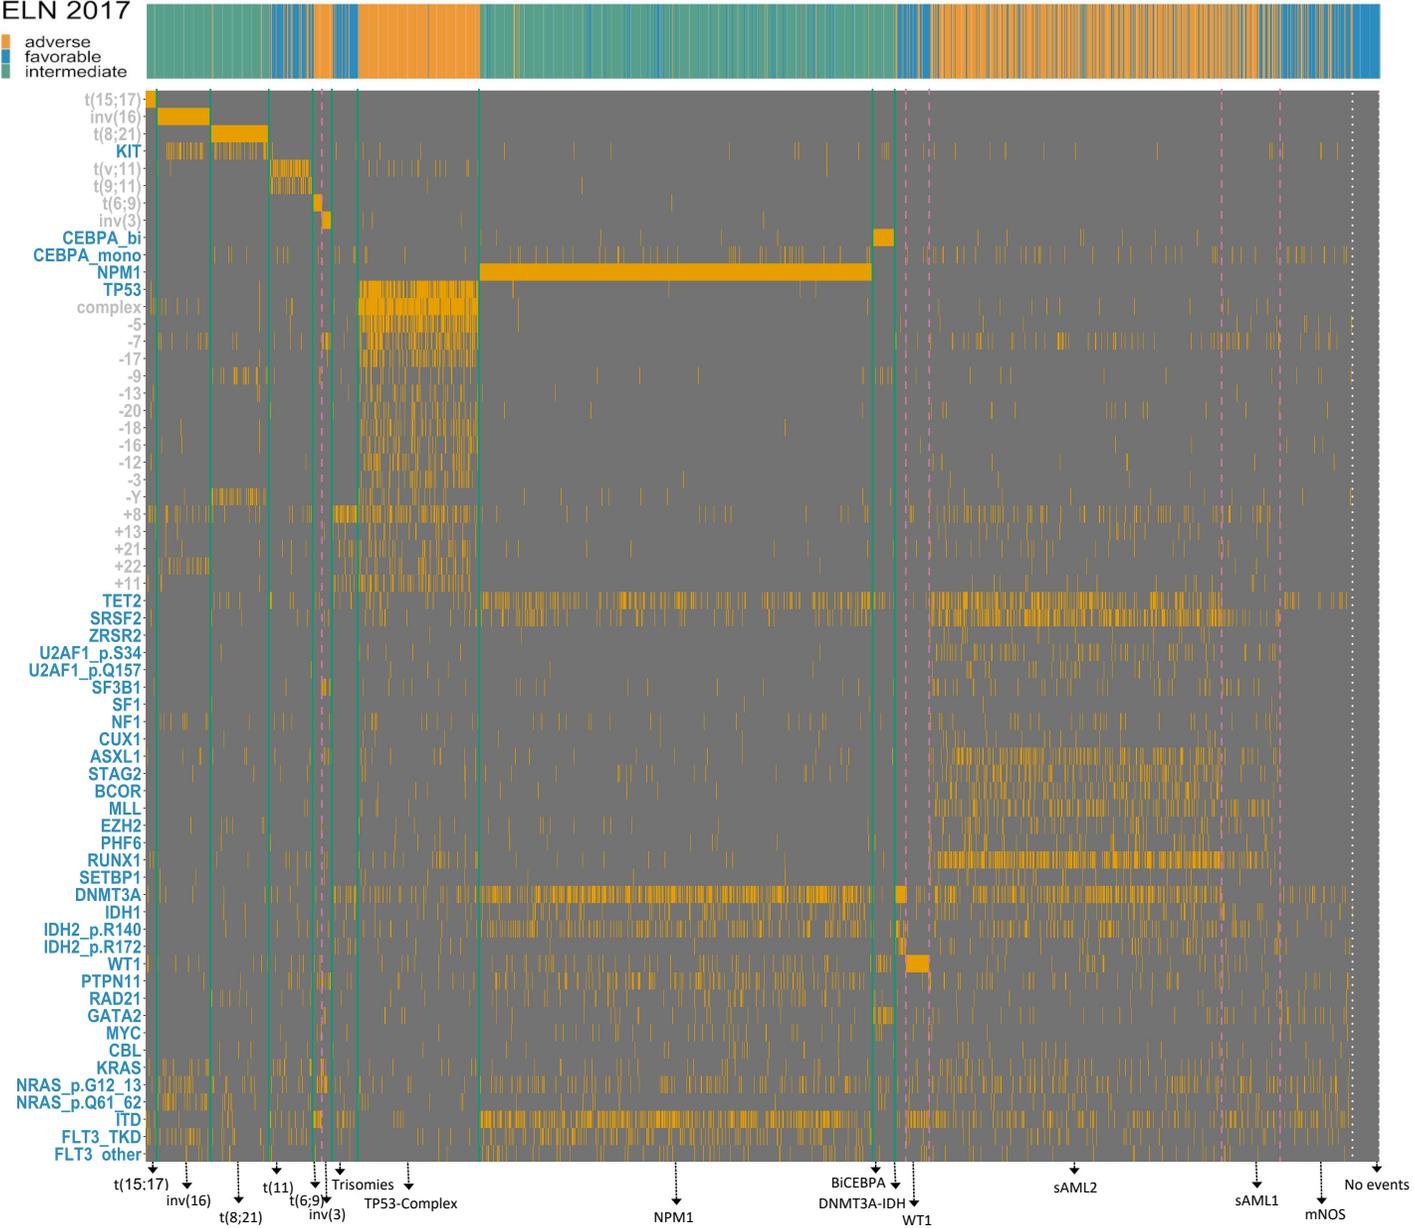

S.Figure 5: Repartition of AML NCRI Cohort (n= 2,113) per WHO 2016 guidelines to include the provisional categories defined by *RUNX1* and t(9;22).

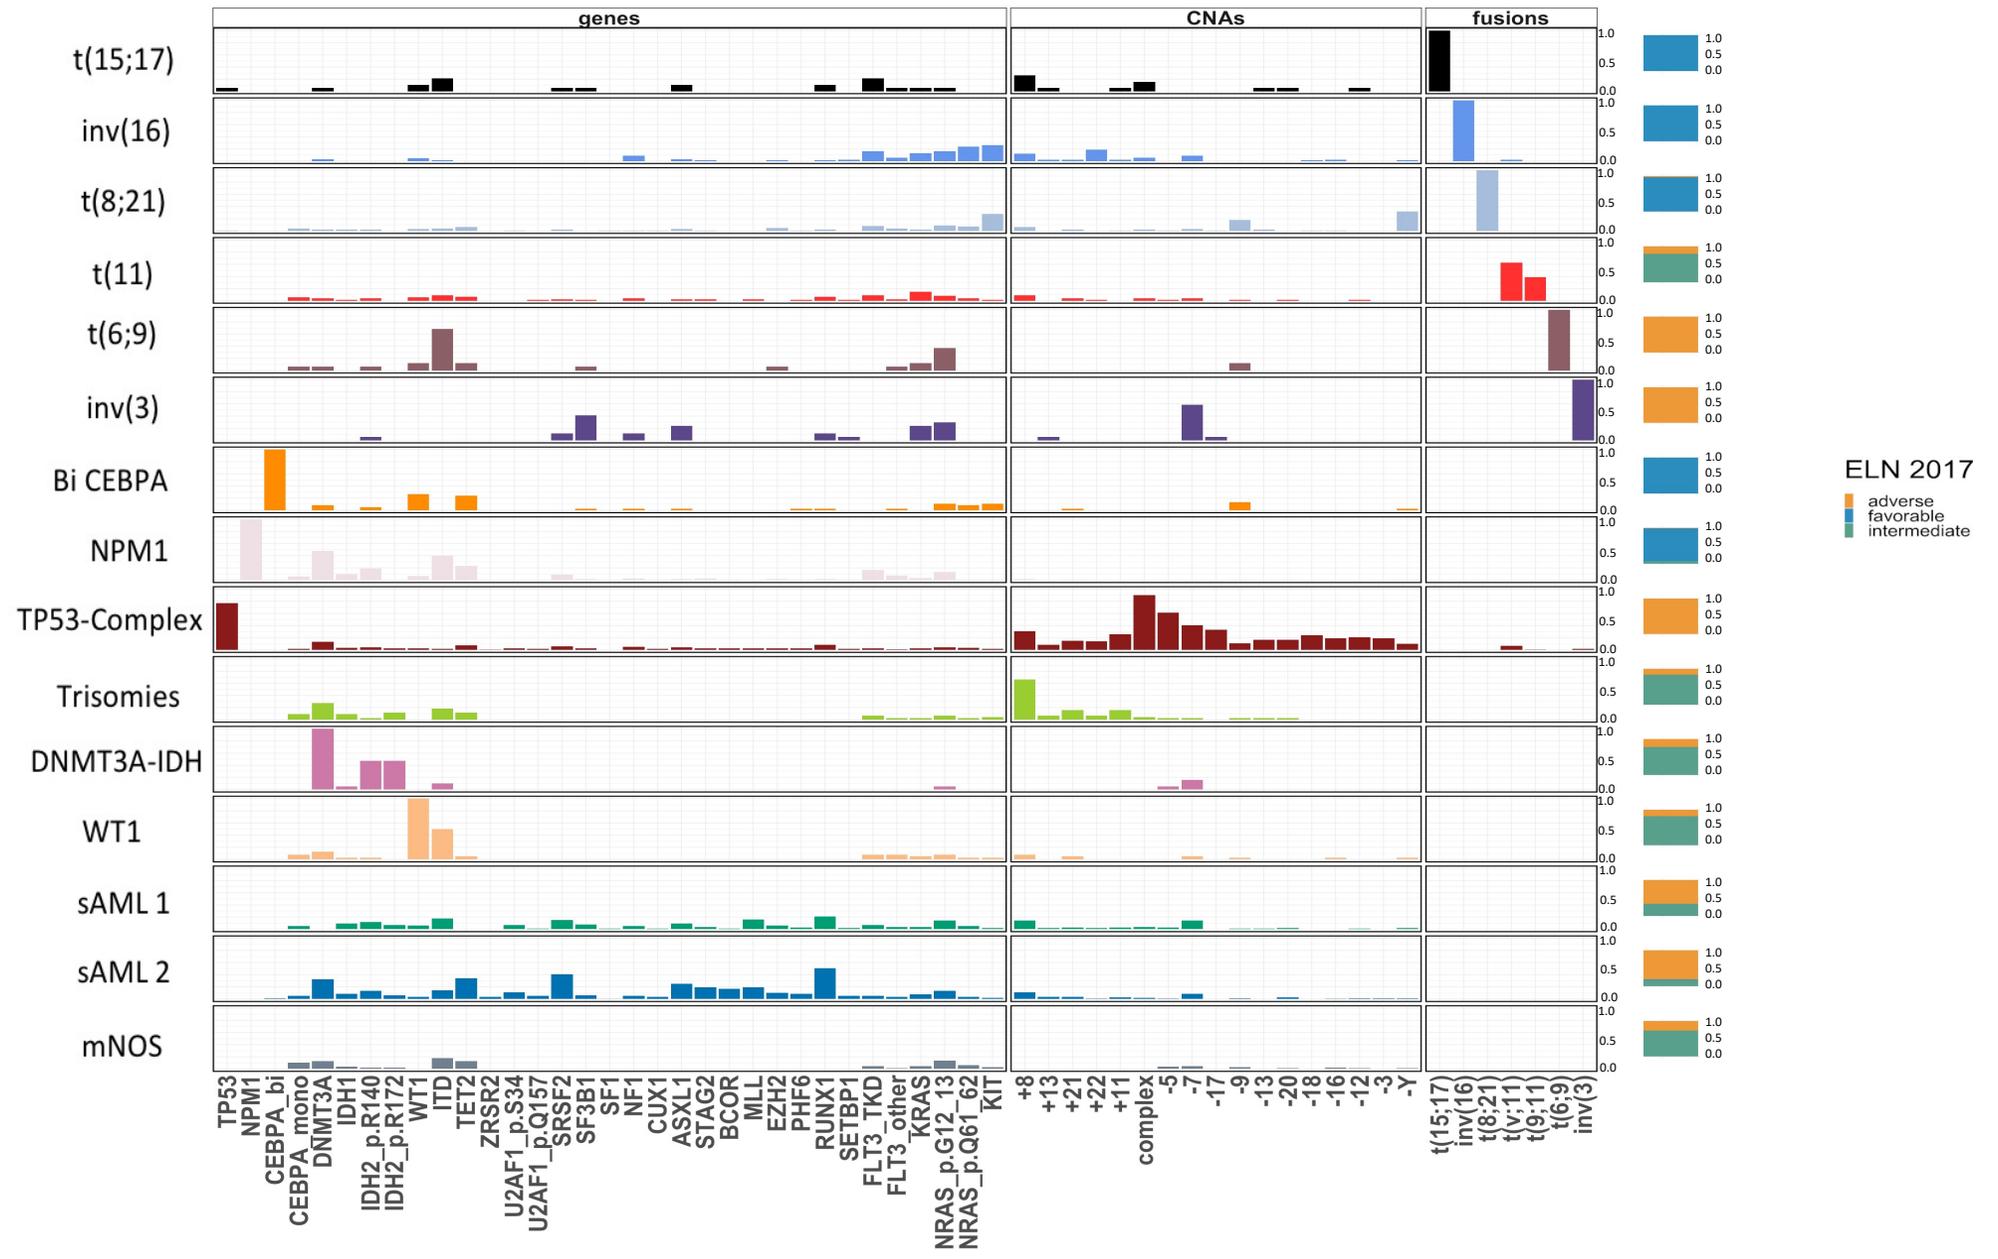

WHO 2016

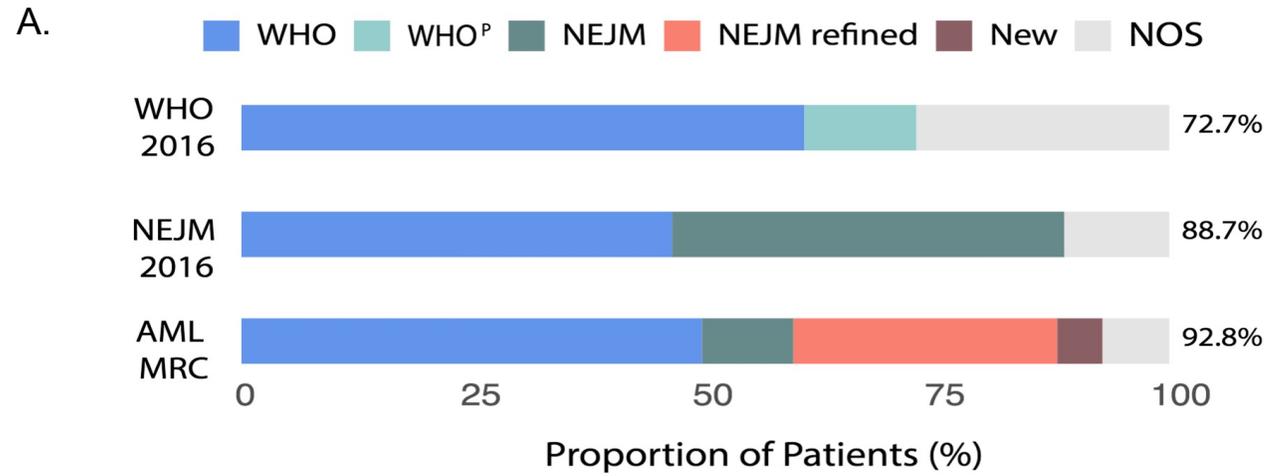

S.Figure 6: Heatmap of Bayesian Dirichlet Process clusters. Rows demarcate distinct genetic lesions, columns represent individual samples. Orange lines in heatmap indicate the presence of a specific genetic lesion. Green and pink dotted lines demarcate major clusters and sub-clusters as derived by the first and second iteration of the Bayesian Dirichlet Process. Dotted white lines demarcate patients in the molecularly not otherwise specified (mNOS) class and the no recurrent molecular findings. The top sidebar indicates ELN²⁰¹⁷ risk score for each patient (blue for favourable, green for intermediate and orange for adverse). For more details on the class assignment process, refer to S.Appendix.

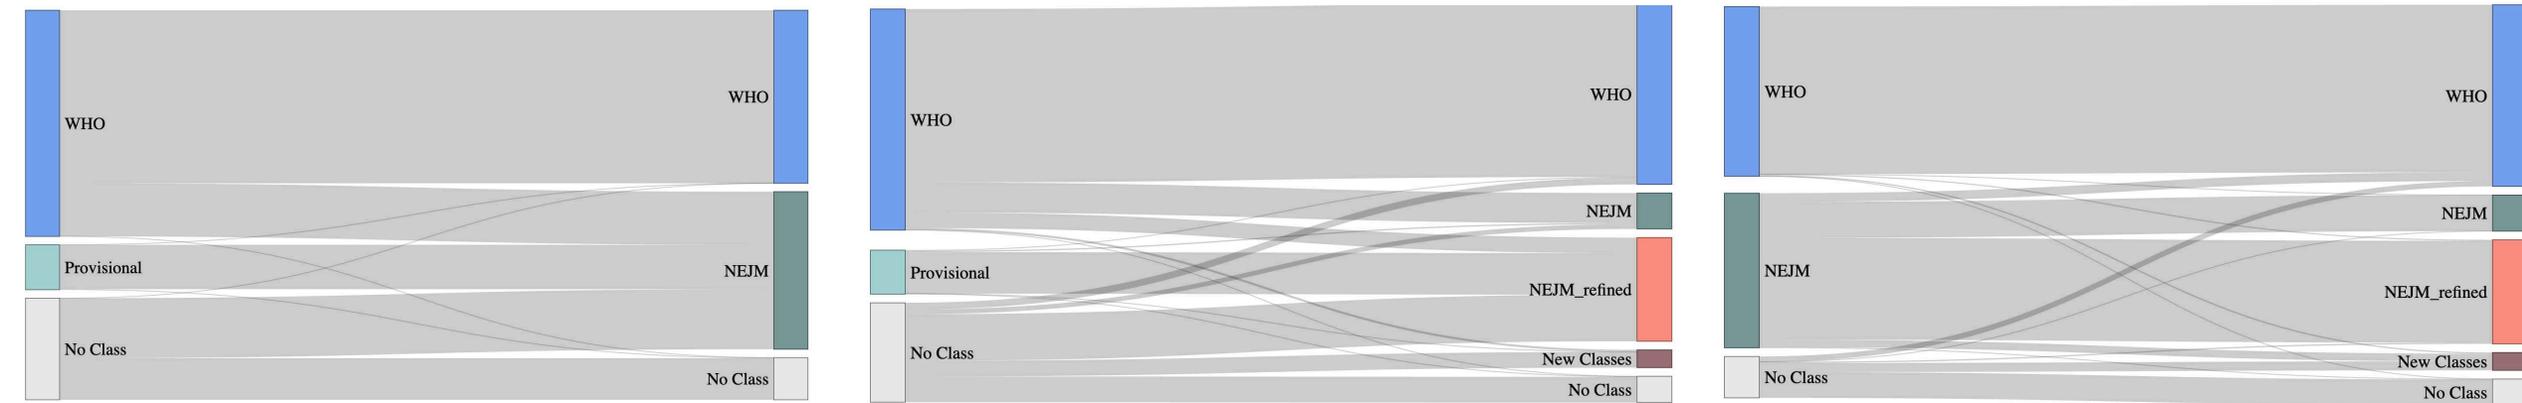

S.Figure 7: Genetic landscape of AML classes. Co-mutation bar plots for acquired gene mutations, chromosomal aneuploidies and fusion genes for each class. The y-axis represents the fraction of patients carrying the driver event (on the x-axis) within each class. For each class vertical sidebar denoting distribution of patients in class across the three (ELN²⁰¹⁷) risk strata (blue for favorable, green for intermediate and orange for adverse).

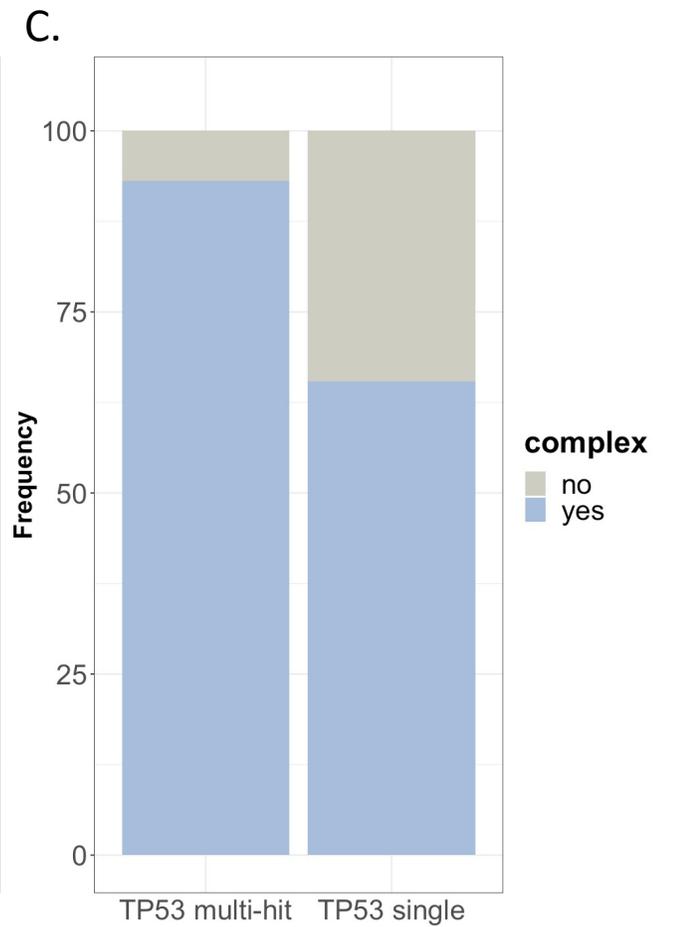

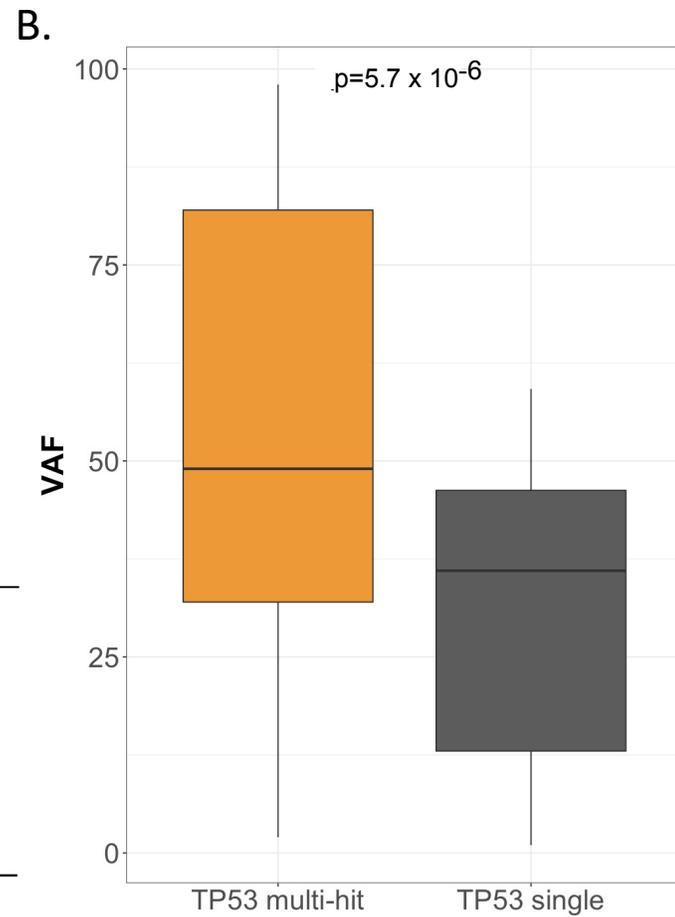

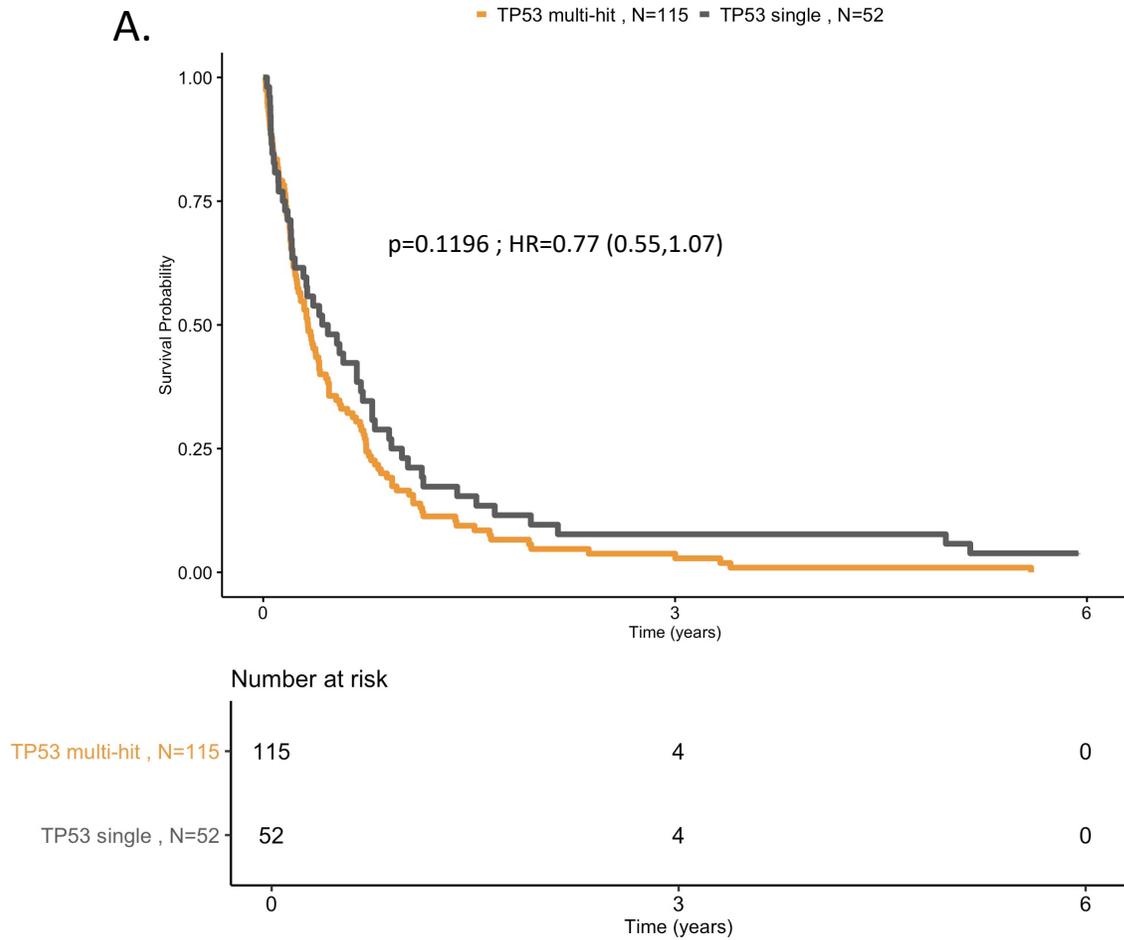

S.Figure 8: Molecular classifications in AML. A. Representation of the AML NCRI cohort (n=2,113 patients) using the WHO classification, the New England Journal of Medicine 2016 classification and the proposed molecular classification in this study. B. Sankey Plots comparing those different classifications. NOS means not otherwise specified.

S.Figure 9: A. Kaplan-Meier Curves for OS and associated risk table comparing TP53 single and multi hit in the AML NCRI cohort (N=2,113). Log-rank tests compared the survival distributions between the 2 subgroups. Annotated P values are from two-sided log-rank tests. B. Comparison of variant allele frequency distribution for TP53 single and multi-hit in the AML NCRI cohort (N=2,113). Pvalue was computed with a two-sided Wilcoxon rank-sum test. C. Comparison of frequency of complex karyotype patients for TP53 single and multi-hit in the AML NCRI cohort (N=2,113). In all boxplots, the median is indicated by the horizontal line and the first and third quartiles by the box edges. The lower and upper whiskers extend from the hinges to the smallest and largest values, respectively, no further than 1.5× interquartile range from the hinges.

S.Figure 10: Kaplan-Meier and associated risk table for overall survival curves for patients with trisomies (<3) (grey), trisomies (>=3) (lightgrey) and complex karyotype (burgundy) in the AML NCRI cohort (N=2,113). Log-rank tests compared the survival distributions between the 3 possible combinations of 2 subgroups. Annotated P values are from two-sided log-rank tests.

S.Figure 21: Forest plot multivariate Cox regression of classes and monosomal karyotype as defined by Breems et al. in NCRI trial study set (n= 2,113). Dots and lines represent estimated hazard ratios and 95% CI, respectively. Dots and lines represent estimated hazard ratios and 95% CI, respectively. ****P < 0.0001, ***P < 0.001, **P < 0.01, ns, not significant. P > 0.05, Wald test.

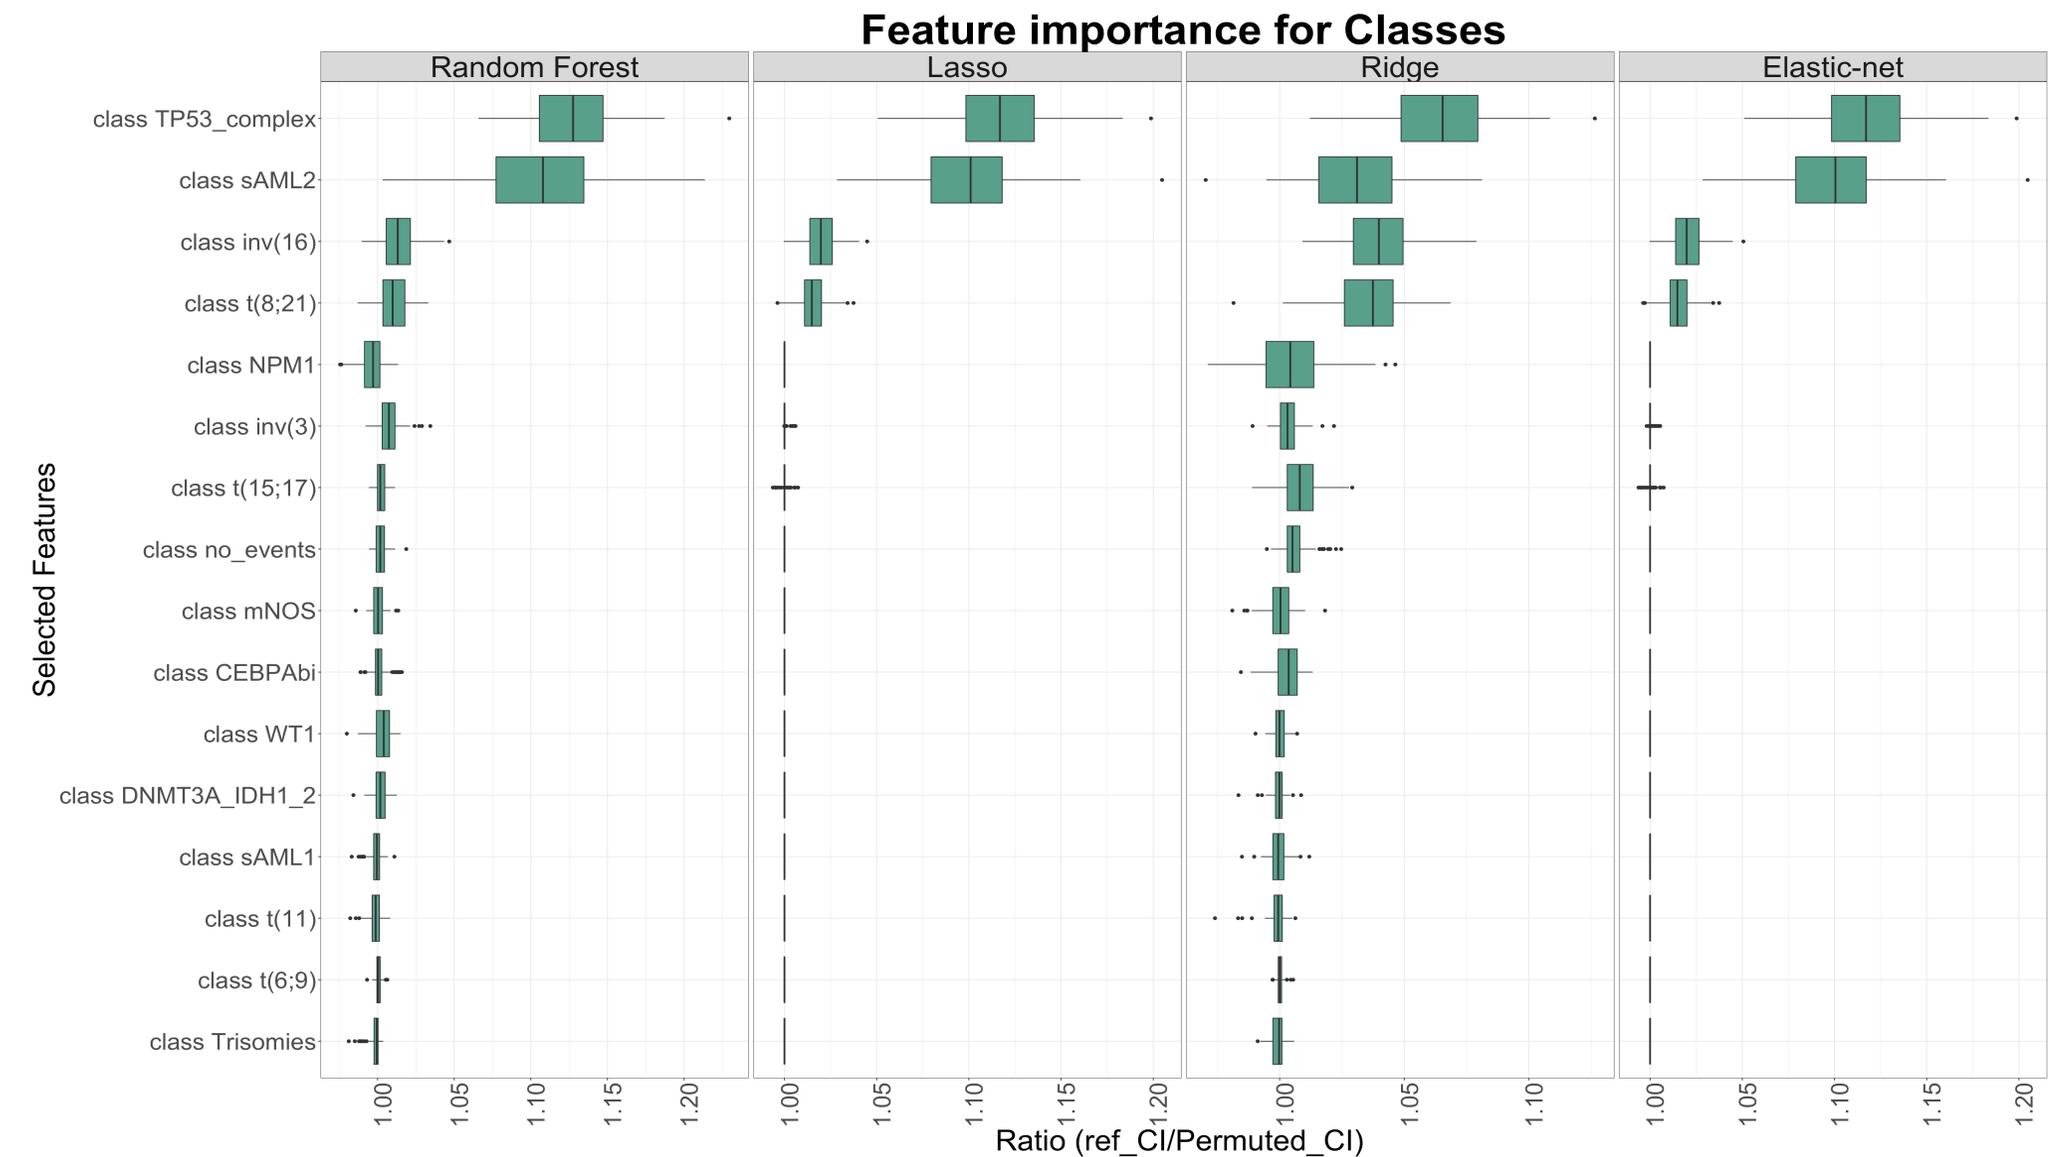

S. Figure 22: Estimates of the concordance index (C-index) derived from Random Forest Survival model that consider ELN²⁰¹⁷ strata; gene mutations; molecular classes; molecular classes + FLT3^{ITD}; genetic data (gene mutations and cytogenetics); clinical and demographic; genetic, clinical and demographic ; classes, FLT3^{ITD}, clinical and demographic features in the AML NCRI trial (n=2,113). The centers of the error bars represent the mean; the lower and upper whiskers represent the 95% CIs. Annotated P values are from two-sided t score test.

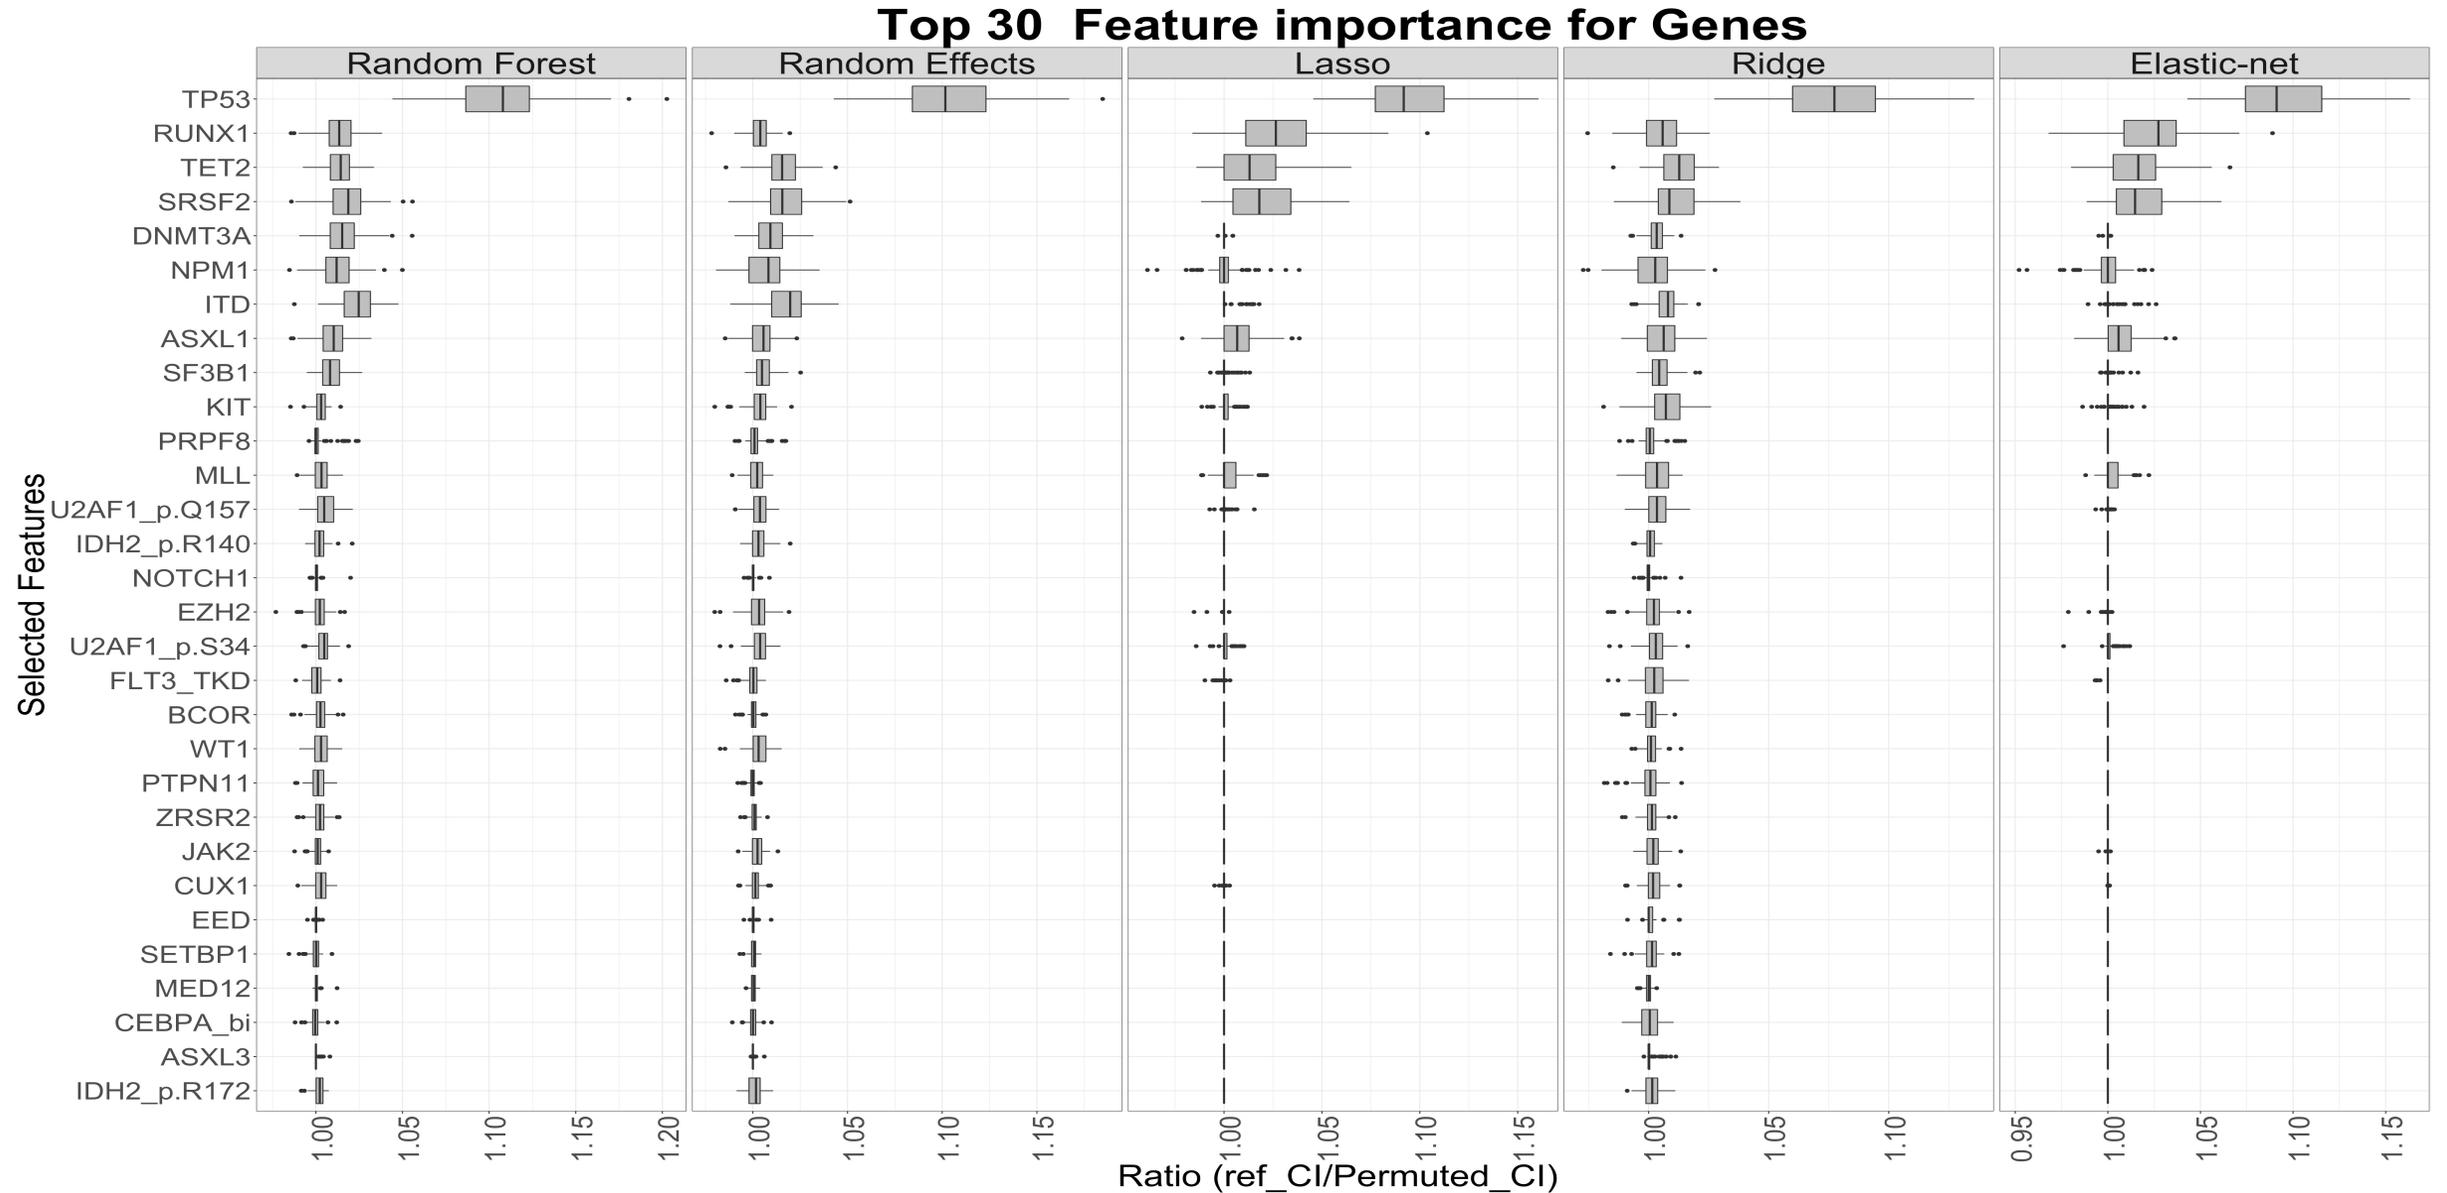

S.Figure 23: Feature Importance in the class based model in AML NCRI Trial (n=2,113).

The y axis corresponds to the different features evaluated by the models and ordered by importance. The x axis corresponds to the reshuffling ratio metric for each feature (metric = reference C-Index / permuted C-Index). The higher the ratio, the more sensitive the model is to that particular feature. The results are stratified by algorithms (Random Forest, Lasso, Ridge and Elastic-Net). For more details, please refer to S.Appendix. We omitted Random Effects algorithms for this class based model as the C-index ratio was constant across features. In all boxplots, the median is indicated by the white dot and the first and third quartiles by the box edges. The lower and upper whiskers extend from the hinges to the smallest and largest values, respectively, no further than 1.5× interquartile range from the hinges.

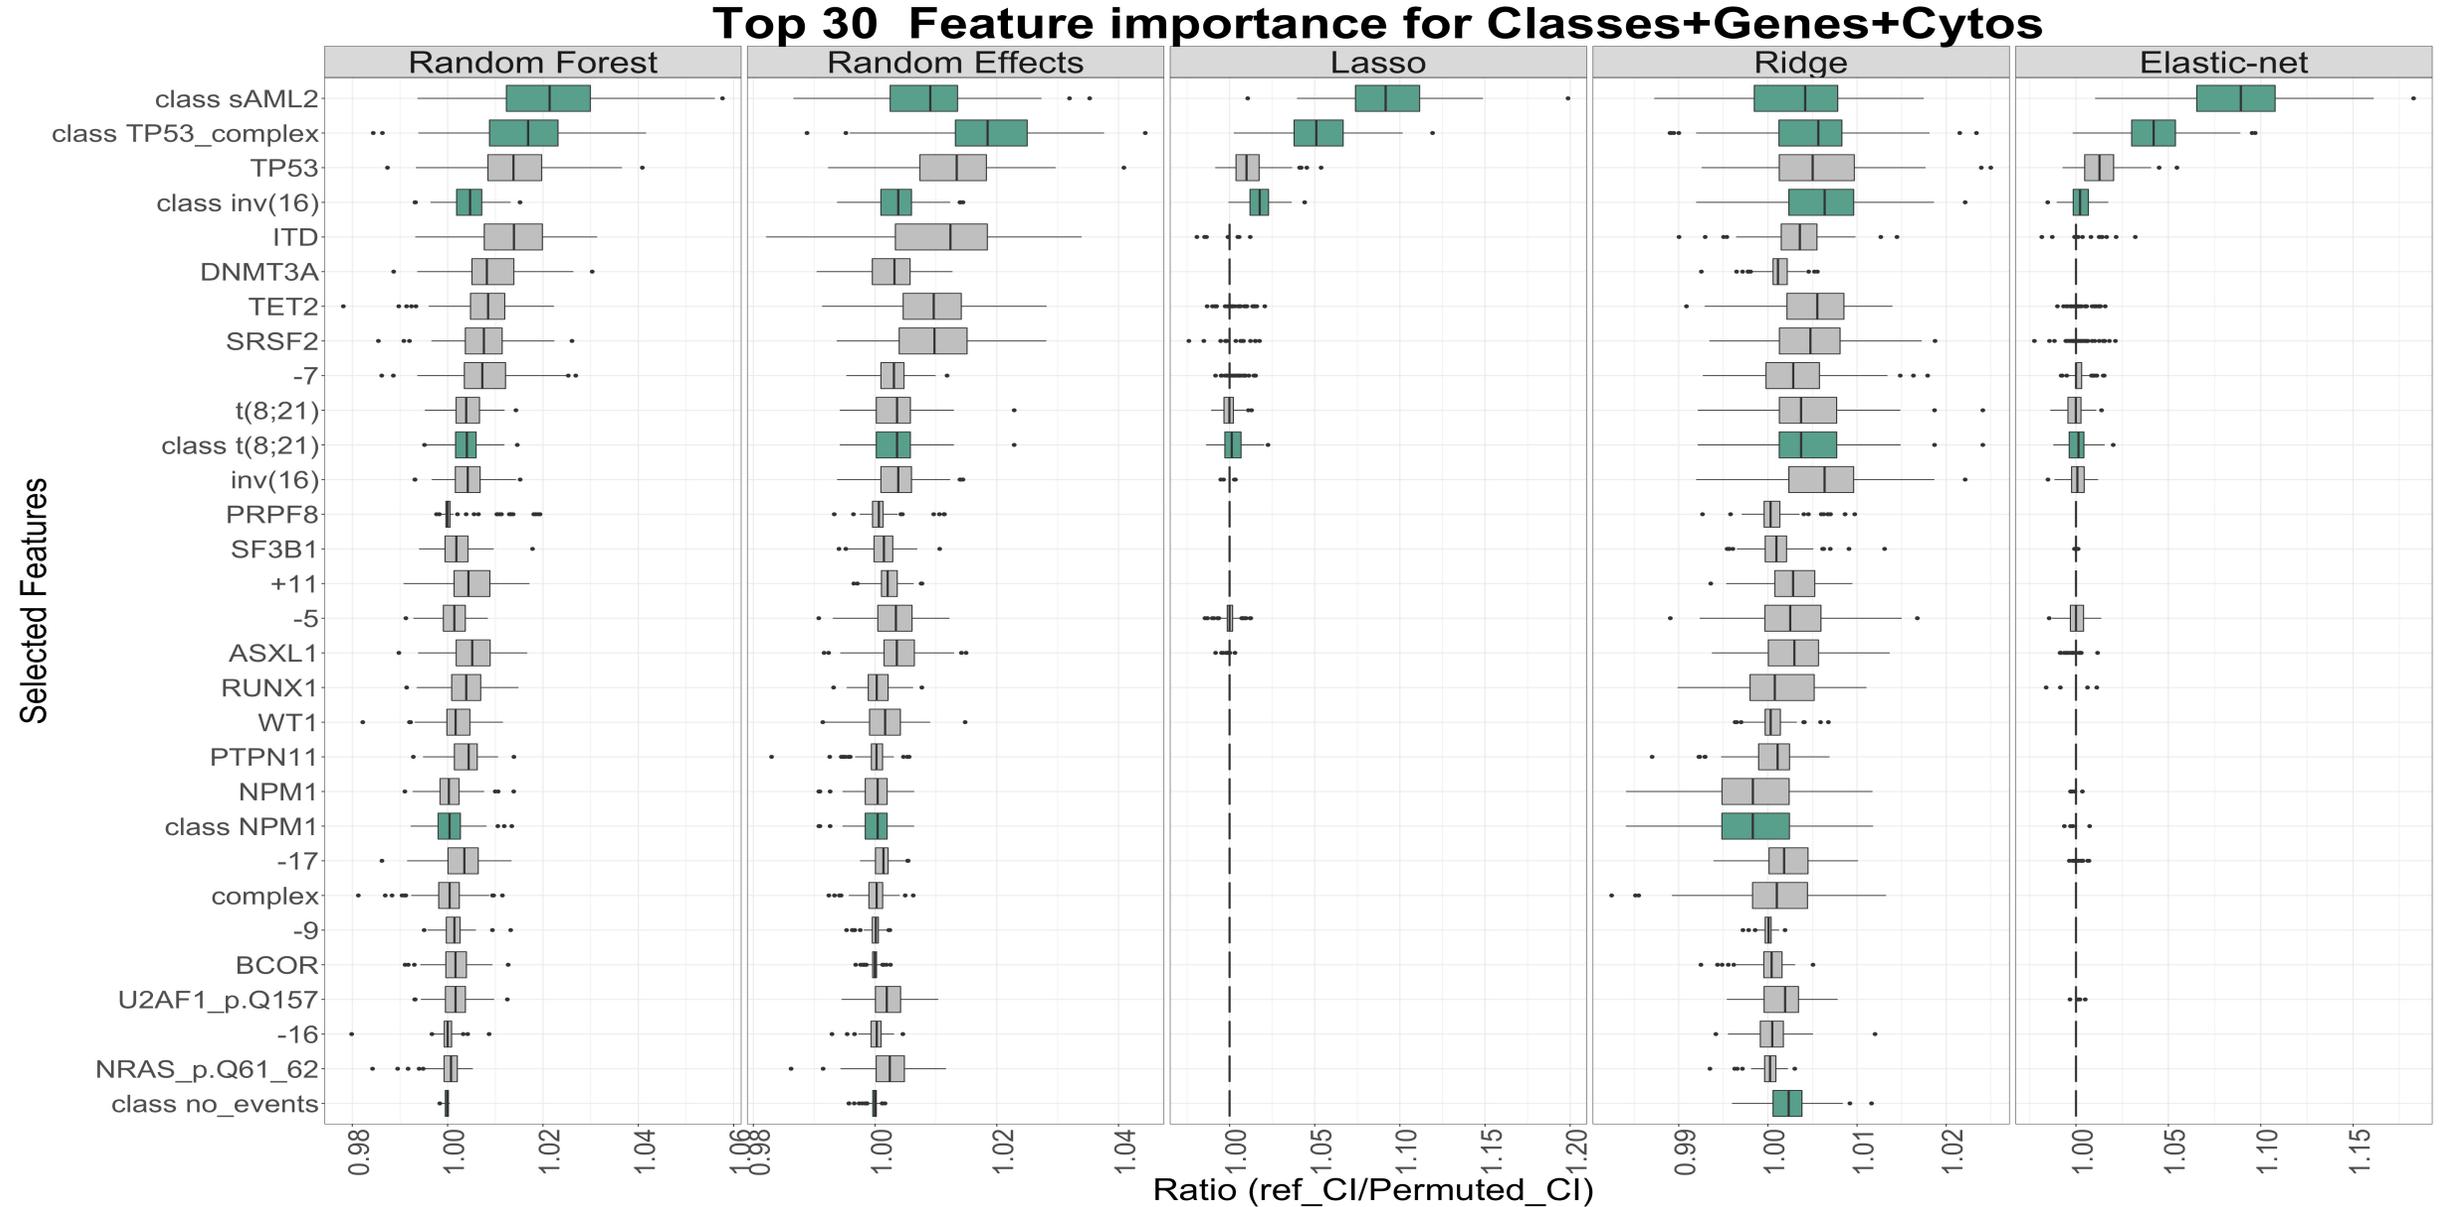

S.Figure 24: Feature Importance in the genes based model (top 30) in AML NCR1 Trial (n=2,113).

The y axis corresponds to the different features evaluated by the models and ordered by importance. The x axis corresponds to the reshuffling ratio metric for each feature (metric = reference C-Index / permuted C-Index). The higher the ratio, the more sensitive the model is to that particular feature. The results are stratified by algorithms (Random Forest, Random Effects, Lasso, Ridge and Elastic-Net). For more details, please refer to S.Appendix. In all boxplots, the median is indicated by the white dot and the first and third quartiles by the box edges. The lower and upper whiskers extend from the hinges to the smallest and largest values, respectively, no further than 1.5× interquartile range from the hinges.

S.Figure 25: Feature Importance in the class + genes + cytogenetics based model (top 30) in AML NCRI Trial (n=2,113).

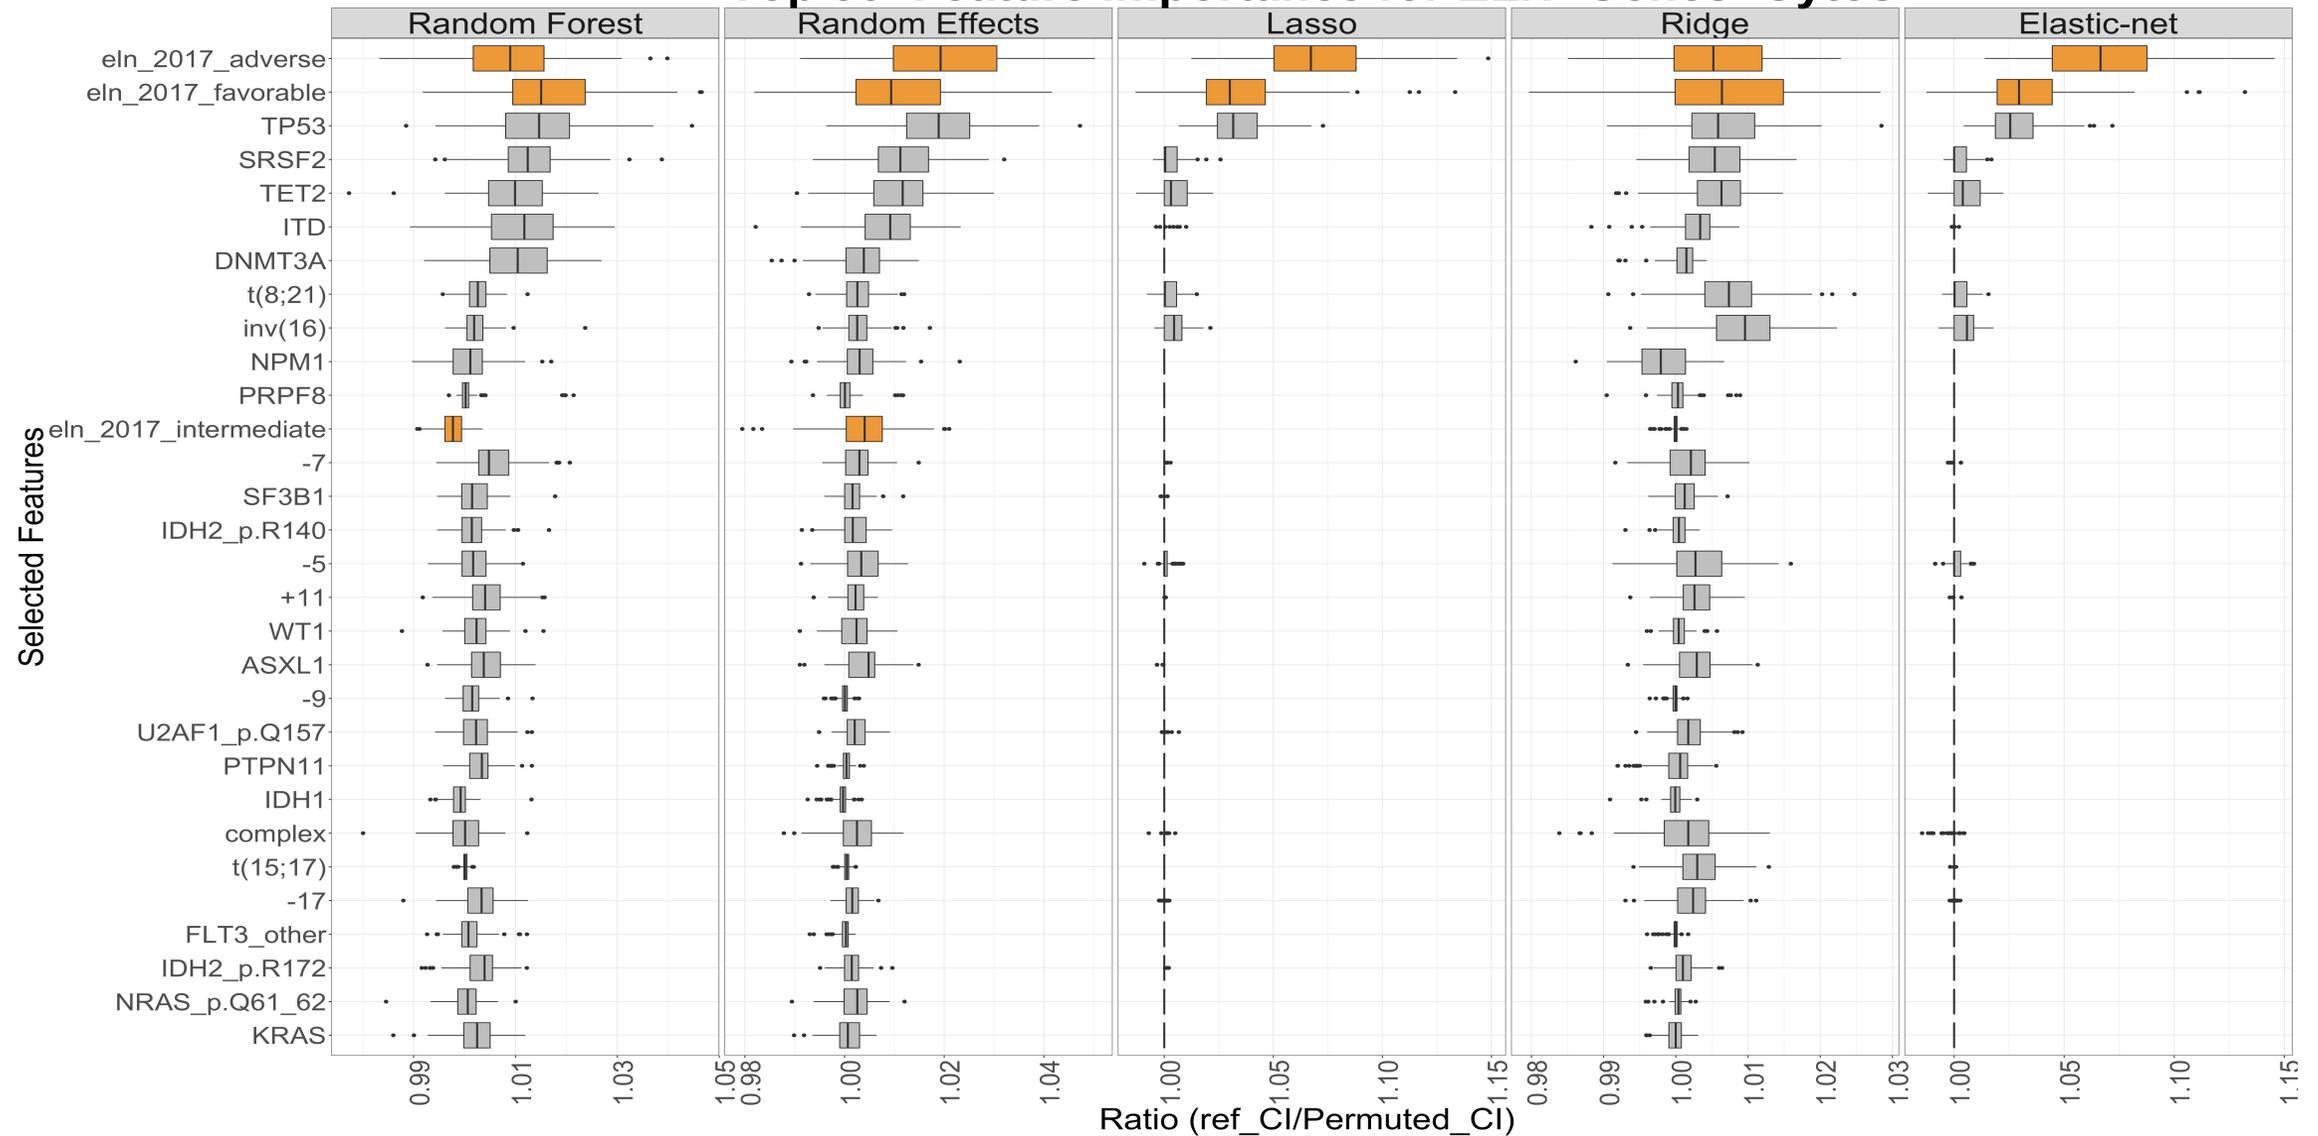

The y axis corresponds to the different features evaluated by the models and ordered by importance. The x axis corresponds to the reshuffling ratio metric for each feature (metric = reference C-Index / permuted C-Index). The higher the ratio, the more sensitive the model is to that particular feature. The results are stratified by algorithms (Random Forest, Random Effects, Lasso, Ridge and Elastic-Net). For more details, please refer to S.Appendix. In all boxplots, the median is indicated by the white dot and the first and third quartiles by the box edges. The lower and upper whiskers extend from the hinges to the smallest and largest values, respectively, no further than 1.5× interquartile range from the hinges.

S.Figure 26: Feature Importance in the ELN + genes + cytos based model (top 30) in AML NCRI Trial (n=2,113).

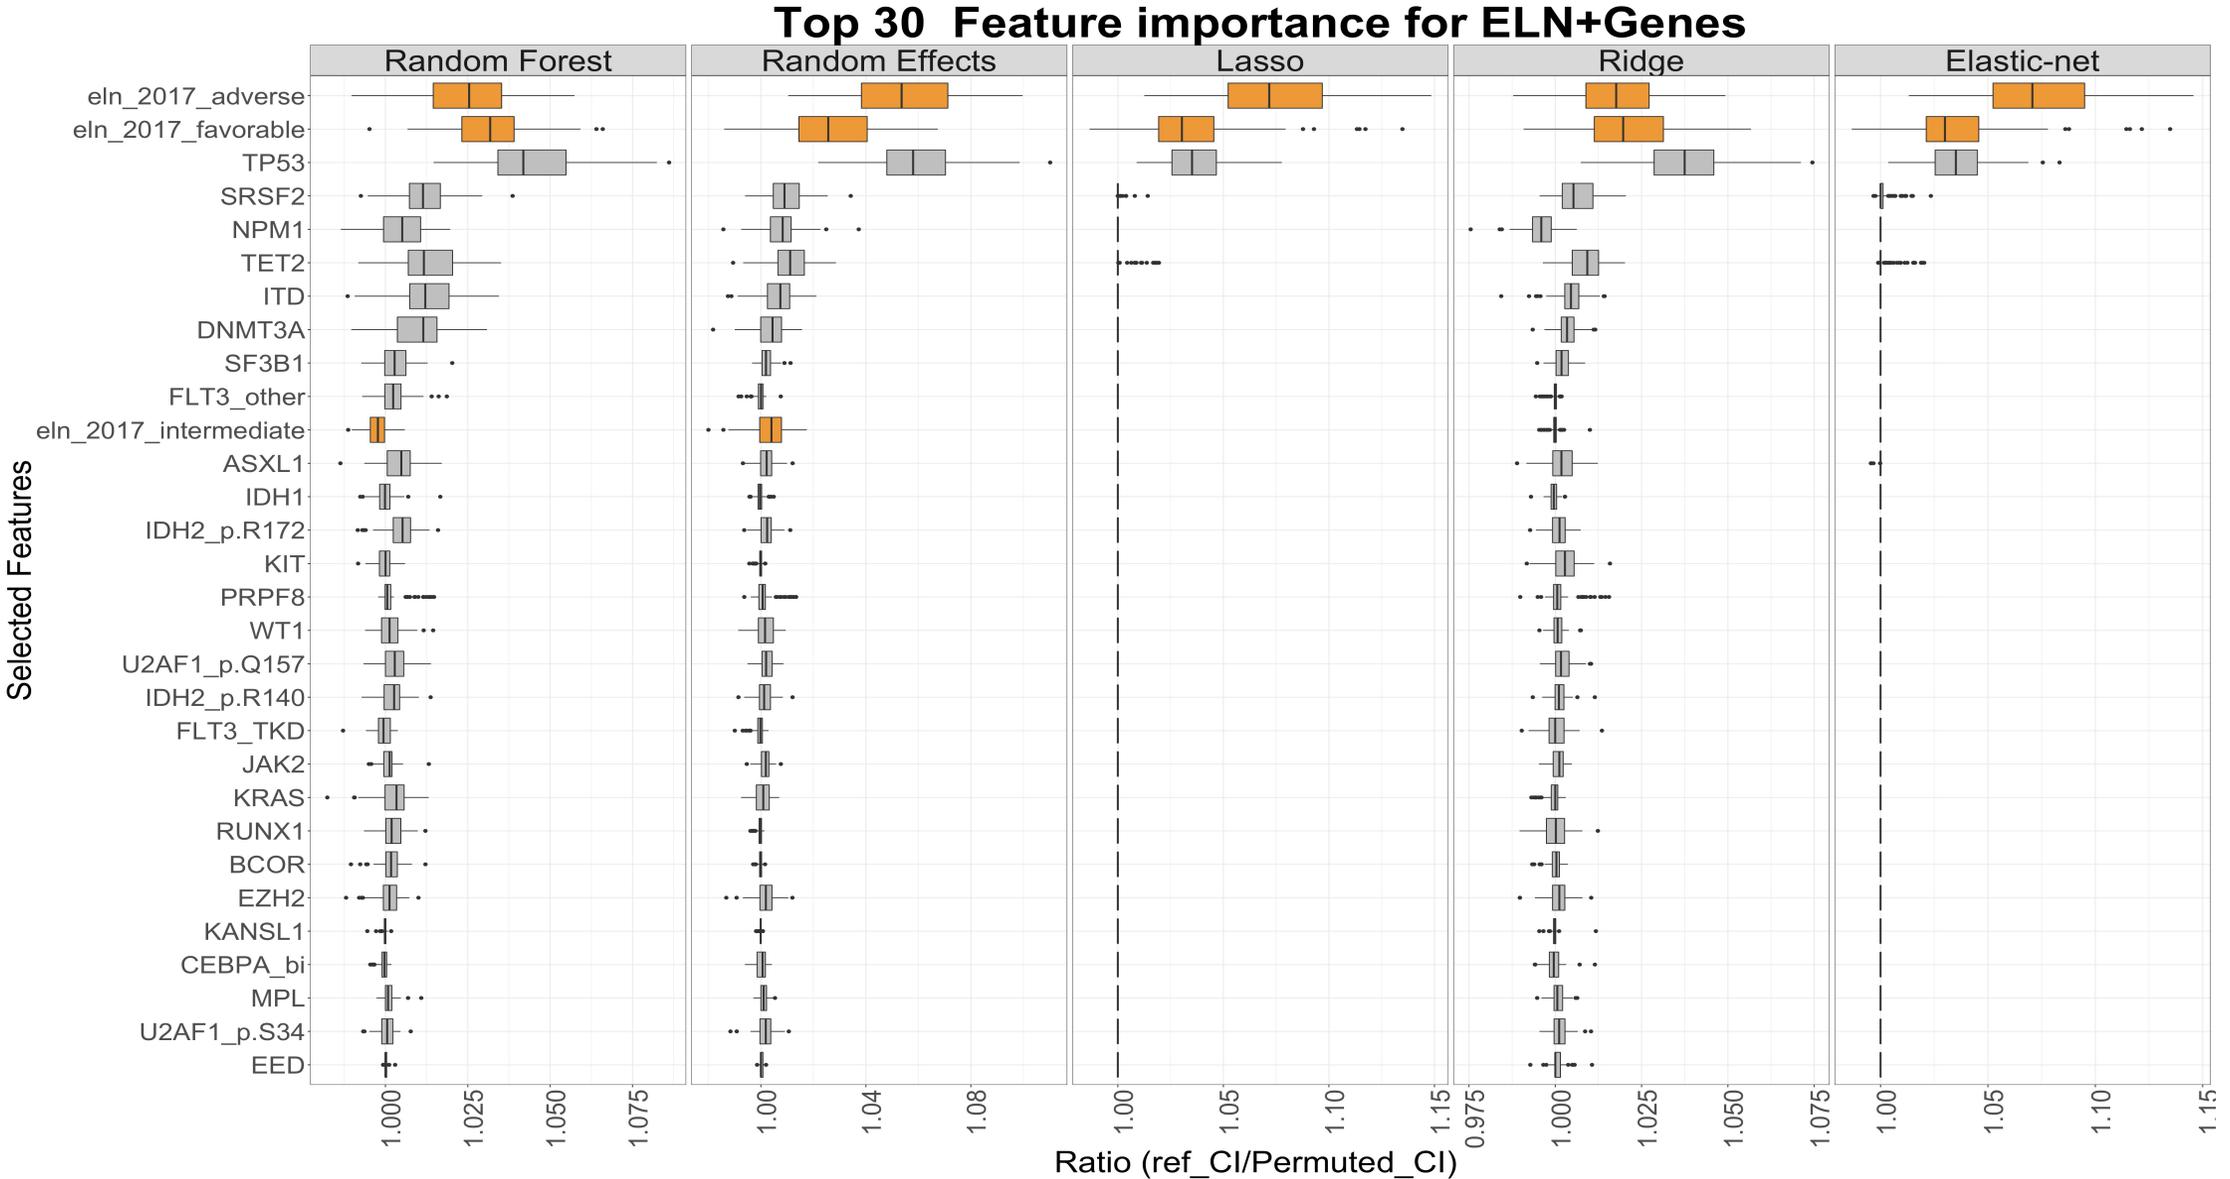

The y axis corresponds to the different features evaluated by the models and ordered by importance. The x axis corresponds to the reshuffling ratio metric for each feature (metric = reference C-Index / permuted C-Index). The higher the ratio, the more sensitive the model is to that particular feature. The results are stratified by algorithms (Random Forest, Random Effects, Lasso, Ridge and Elastic-Net). For more details, please refer to S.Appendix. In all boxplots, the median is indicated by the white dot and the first and third quartiles by the box edges. The lower and upper whiskers extend from the hinges to the smallest and largest values, respectively, no further than 1.5× interquartile range from the hinges.

Top 30 Feature importance for ELN+Genes+Cytos

S.Figure 27: Feature Importance in the ELN + genes based model (top 30) in AML NCR1 Trial (n=2,113).

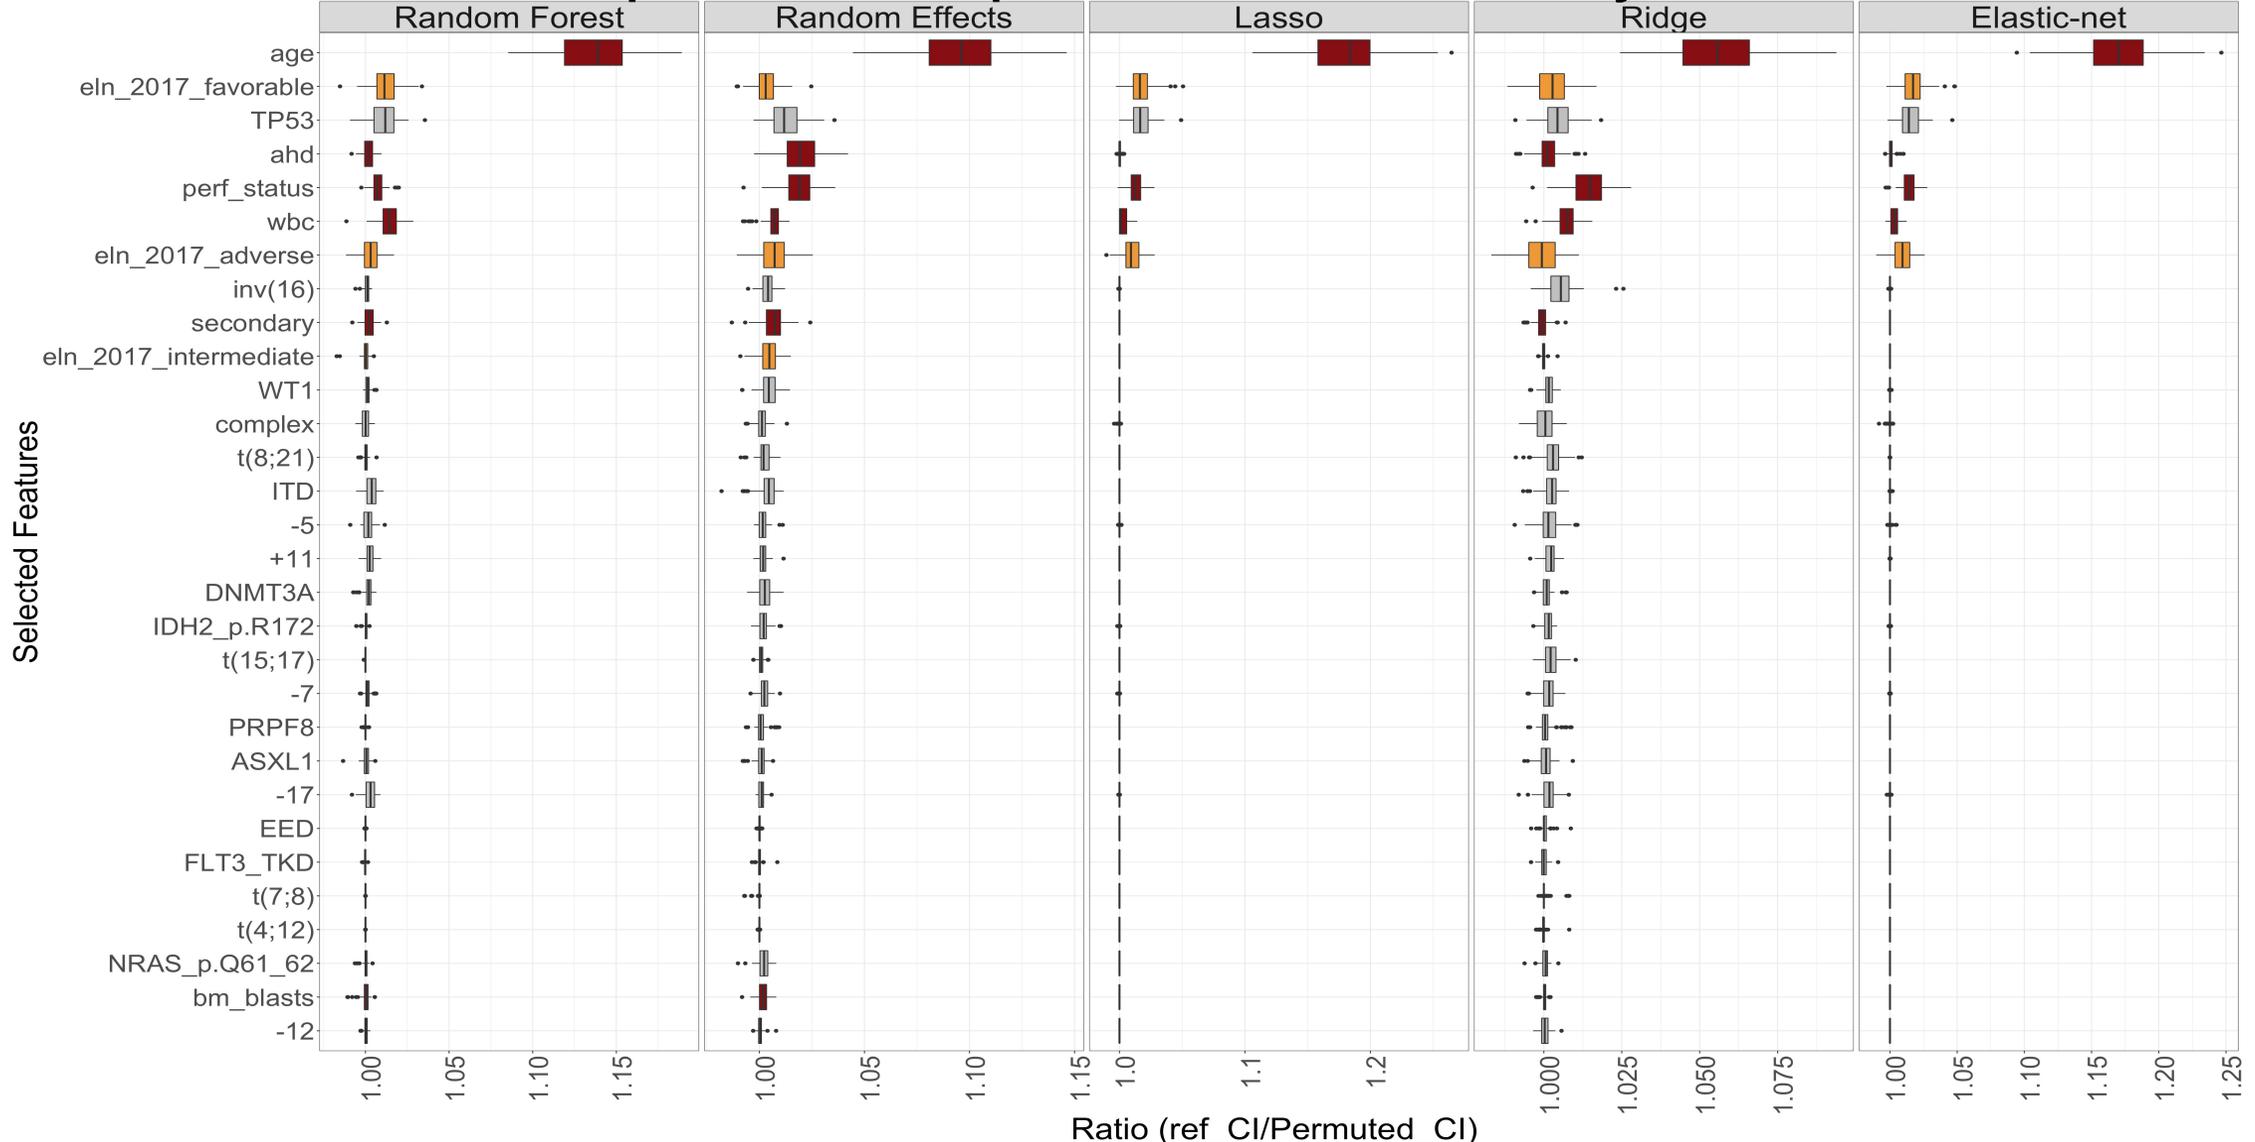

The y axis corresponds to the different features evaluated by the models and ordered by importance. The x axis corresponds to the reshuffling ratio metric for each feature (metric = reference C-Index / permuted C-Index). The higher the ratio, the more sensitive the model is to that particular feature. The results are stratified by algorithms (Random Forest, Random Effects, Lasso, Ridge and Elastic-Net). For more details, please refer to S.Appendix. In all boxplots, the median is indicated by the white dot and the first and third quartiles by the box edges. S.Figure 31: Prognosis Evolution Validation of C-Index in the AML SG Cohort (1,540 patients).

A. Bar plots of number of features for the different models that were evaluated to include: ELN²⁰¹⁷, classes, classes + ITD, genes, clinical data, genes + cytogenetics, classes + clinical data, genes + cytogenetics + clinical data.

B. Concordance Index (C-Index) measured using a Cox Ridge model on different subsets of the features (ELN²⁰¹⁷, classes, classes + ITD, genes, clinical data, genes + cytogenetics, classes + clinical data, genes + cytogenetics + clinical data) with internal 5 fold cross-validation for the regularization parameter λ . We randomly reshuffled the data (n=1,540) and used 75% for training and cross validation and the remaining 25% for testing. We used 100 Bootstraps iterations on the test set to produce the box plots with 95% confidence interval and we evaluated the p-values by comparing the differences in C-index distributions on the displayed models. We trained different models (penalized Cox Models, Random Forest, Cox Boosting, Cox Random Effects and Support Vector Machines) and here we display the results for the Ridge Cox Model. For more details, please refer to S.Appendix. The bar plots represent the number of features used to evaluate the C-Index on the different subsets of features. The centers of the error bars represent the mean; the lower and upper whiskers represent 95% CIs. Annotated P values are from two-sided t score test.

S. Figure 39: Kaplan-Meier overall survival curves, cumulative incidence of relapse and associated risk tables for the sAML2, sAML1 subgroups that attained CR in AML17, stratified by MRD status post course 1. Two-sided Pvalues were computed with Gray's test and log-rank test.

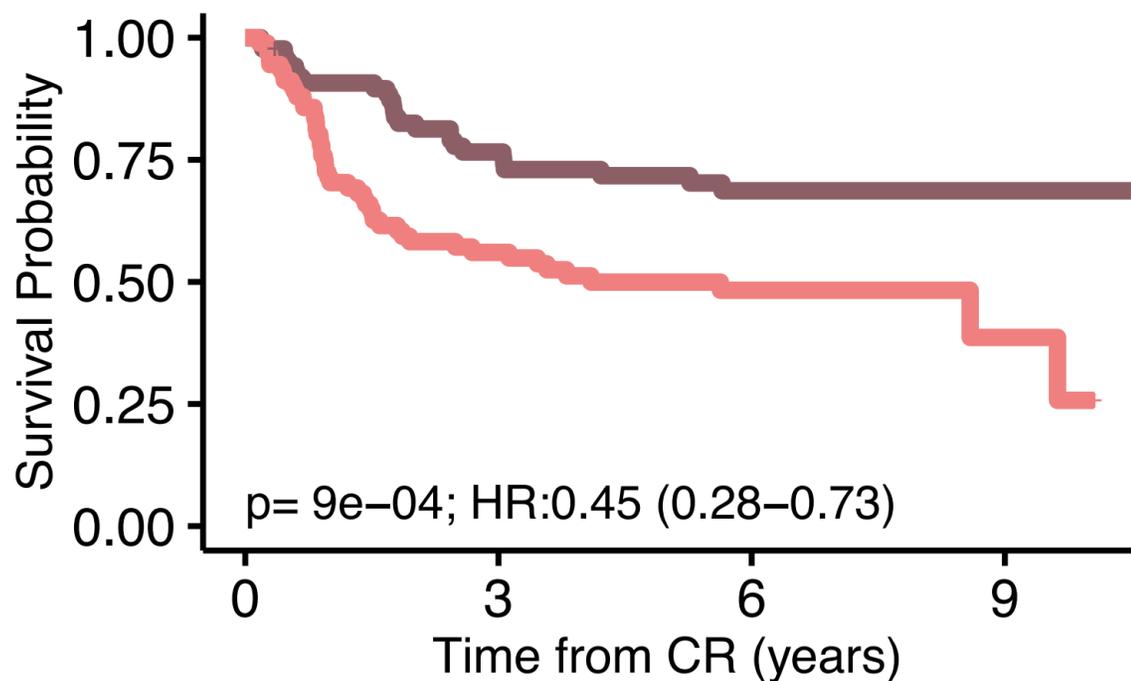

S. Figure 40: Summary by class for cumulative incidence and Kaplan-Meier curves for survival post complete remission on AML 17 NCRI Trial Cohort with post course 1 minimal residual disease (MRD) analysis analysis (n=523). The first panel represents the cumulative incidence of relapse for patients in that specific class stratified by MRD status (p values were computed with Gray test) and the second panel represents the Kaplan-Meier curve for survival post course 1 complete remission stratified by MRD status. We omitted classes with less than 3 patients with MRD positive or negative. Panels where comparator group has less than 10 patients have been removed for robust statistical interpretation. Two-sided Pvalues were computed with Gray's test and log-rank test.

S.Figure 42: Univariate and Multivariate Regression plots for model containing classes, ITD, clinical information as well as minimal residual disease (MRD) status for relapse (panel A) and survival post complete remission (panel B) endpoints in the AML 17 NCRI Trial Cohort with post course 1 MRD analysis (n=523).

A. The first panel represents a univariate Cox model for all the covariates mentioned above for the relapse endpoint. The second panel represents a multivariate Cox model for all the covariates mentioned above for the relapse endpoint (β coefficients were averaged over 100 iterations).

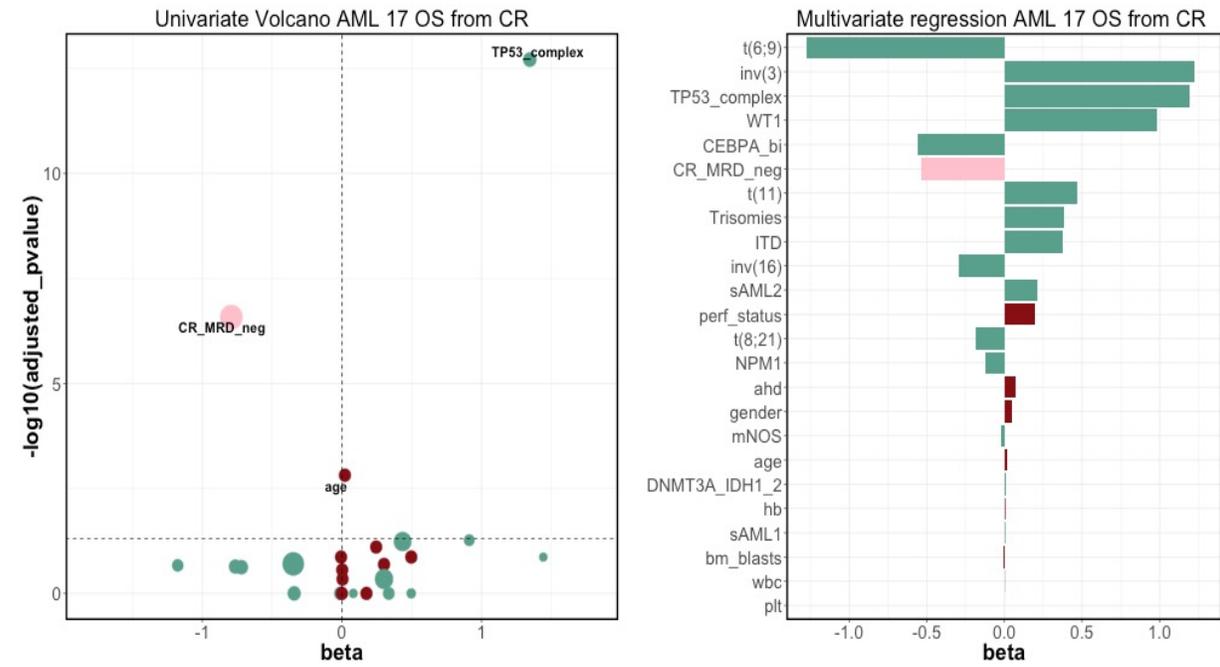

B. The first panel represents a univariate Cox model for all the covariates mentioned above for the death from complete remission endpoint. The second panel represents a multivariate Cox model for all the covariates mentioned above for the survival post complete remission endpoint (β coefficients were averaged over 100 iterations).

The horizontal dotted curve corresponds to the pvalue threshold of 0.05 and the vertical one correspond to $\beta=0$ on the x axis. We highlighted the predictors that have a significant effect (pvalue greater than the threshold :0.05 here). The colors correspond to different types for the covariates: green for classes and ITD, pink for MRD status, red for clinical data. Wald test pvalues are adjusted to correct for multiple comparisons.

S.Figure 43: Univariate and Multivariate Regression plots for the classes, ITD stratified by minimal residual disease (MRD) status on Relapse (panel A) and survival post complete remission (panel B) endpoints in the AML 17 NCRI Trial Cohort with post course 1 MRD analysis (n=523).

A. The first panel represents a univariate Cox model for all the classes stratified by MRD status for the relapse endpoint. The second panel represents a multivariate Cox model for all the covariates mentioned above stratified by MRD status for the relapse endpoint (β coefficients were averaged over 100 iterations). We further stratified NPM1 class based on ITD status.

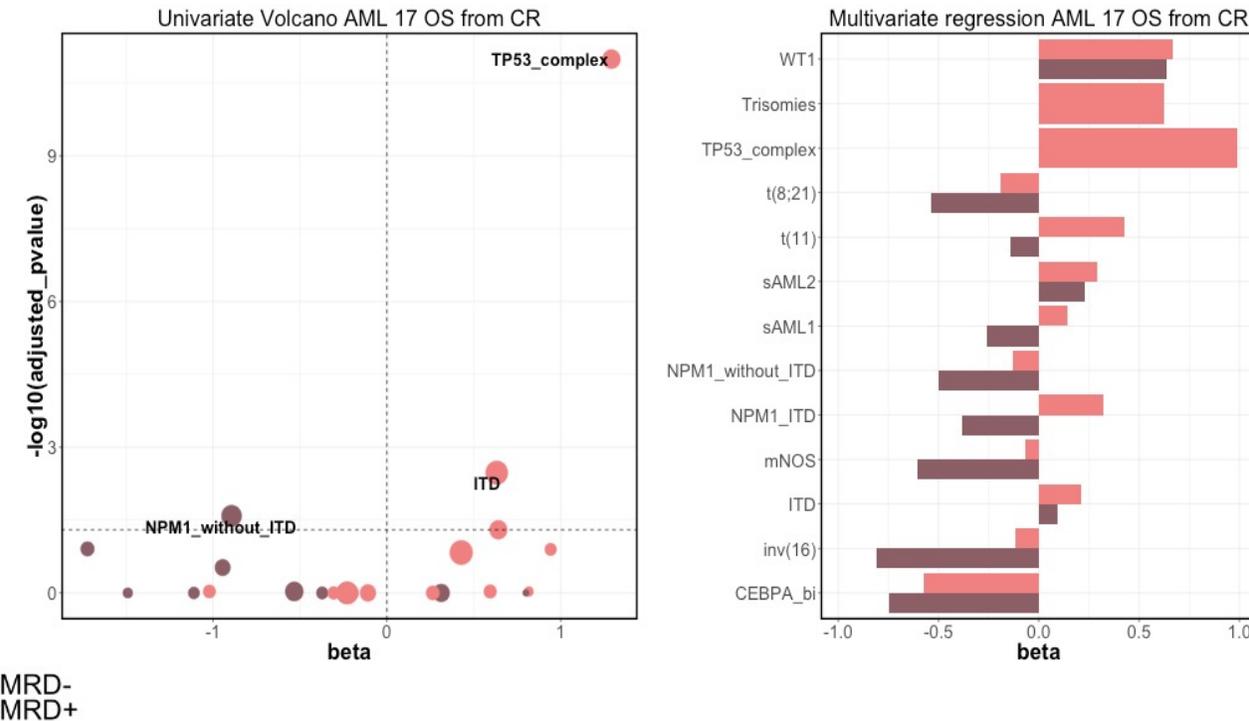

B. The first panel represents a univariate Cox model for all the classes stratified by MRD for the death from complete remission endpoint. The second panel represents a multivariate Cox model for all the covariates mentioned above stratified by MRD for the death from complete remission endpoint (β coefficients were averaged over 100 iterations). We further stratified NPM1 class based on ITD status.

The horizontal dotted curve corresponds to the pvalue threshold of 0.05 and the vertical one corresponds to $\beta=0$ on the x axis. We highlighted the predictors that have a significant effect (pvalue greater than the threshold :0.05 here). The two colors are defined in the legend corresponding to the stratification of each covariate based on MRD status. Wald test pvalues are adjusted to correct for multiple comparisons.

S.Figure 45: Kaplan-Meier curves for overall survival and associated risk table comparing patients with t(6;9) with and without ITD with patients in intermediate and adverse ELN²⁰¹⁷ on the combined (n=3,653) training AML NCRI (n=2,113) and validation AML SG cohort (n=1,540). Dotted curves represent the ELN²⁰¹⁷ risk categories. Annotated P values are from two-sided log-rank tests.

S.Figure 46: Kaplan-Meier overall survival curves and associated risk tables comparing each of the proposed risk strata (Favorable^P, Intermediate^P, Adverse^P) by the presence of NPM1 and FLT3^{ITD} status for the Favorable^P and by FLT3^{ITD} status for the Intermediate^P and Adverse^P in the training AML NCRI cohort (n=2,113) and the validation AML SG cohort (n=1,540). Annotated P values are from two-sided log-rank tests.

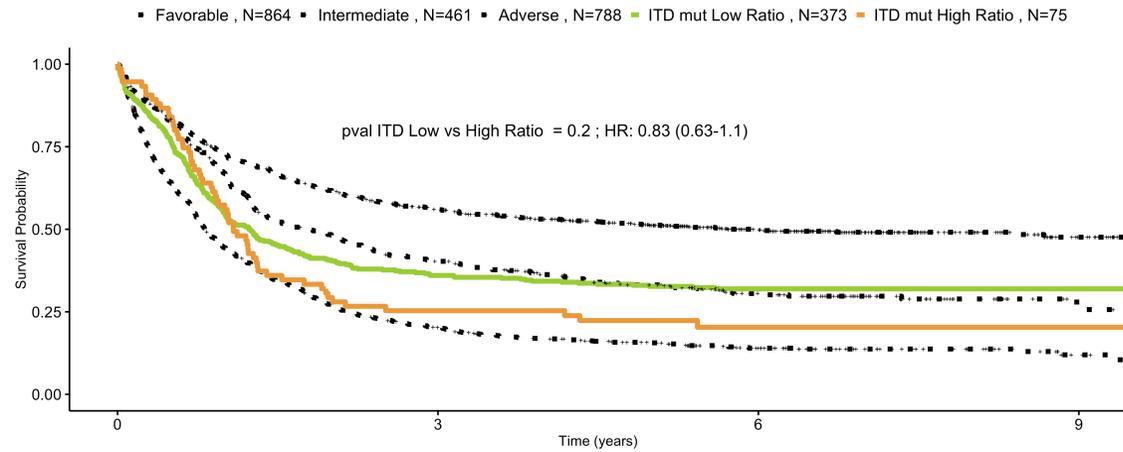

S. Figure 47: Kaplan-Meier curves for overall survival and associated risk tables comparing ITD clinical ratio for all ITD mutated patients and for the subset of patients with both NPM1 and ITD mutations on the AML NCRI cohort (n=2,113).

A. Kaplan-Meier curves for overall survival comparing ITD ratio (low is less than 50 and high is more than 50) for ITD mutated patients on the AML NCRI cohort (n=2,113). Dotted curves represent the ELN²⁰¹⁷ risk categories.

B. Kaplan-Meier curves for overall survival comparing ITD ratio (low is less than 50 and high is more than 50) for patients that have both NPM1 and ITD mutations on the AML NCRI cohort (n=2,113). Dotted curves represent the ELN²⁰¹⁷ risk categories.

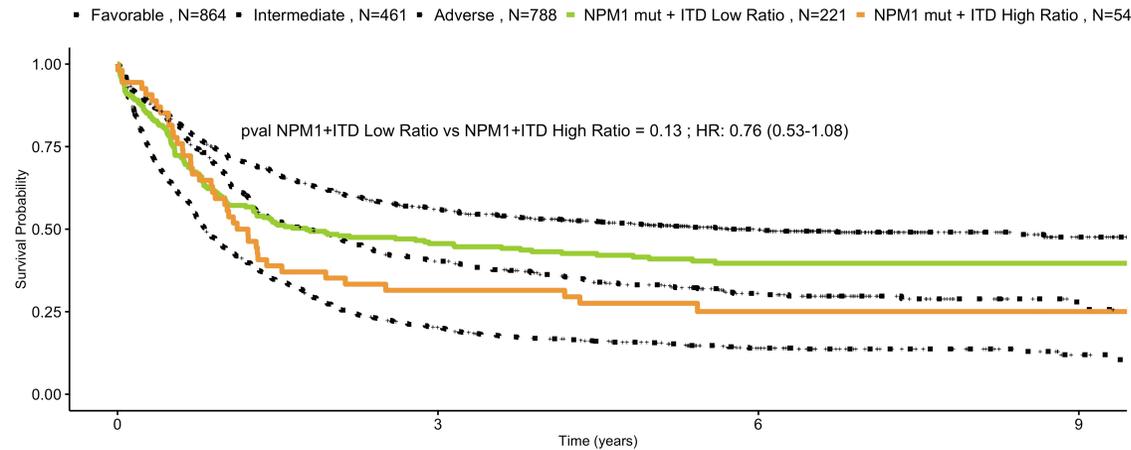

P values were computed using log-rank test to compare ITD ratio survival differences. Annotated P values are from two-sided log-rank tests.

S. Figure 48: Comparison of ELN²⁰¹⁷ and new risk proposal in the training AML NCRI (n=2,113) and validation AML SG Cohort (n=1,540).

A. Top panel : Bar plots of frequencies of ELN²⁰¹⁷ risk categories stratified by proposal categories in the training (n=2,113) and validation cohort (n=1,540). Bottom panel : Bar plots of frequencies of proposal risk categories stratified by ELN²⁰¹⁷ categories in the training (n=2,113) and validation cohort (n=1,540).

B. Kaplan-Meier curves for overall survival comparing the ELN²⁰¹⁷ risk categories and the new risk proposal categories in the training (n=2,113) and validation cohort (n=1,540). Dashed curves are the three ELN²⁰¹⁷ risk categories and plain curves are the three risk proposal categories.

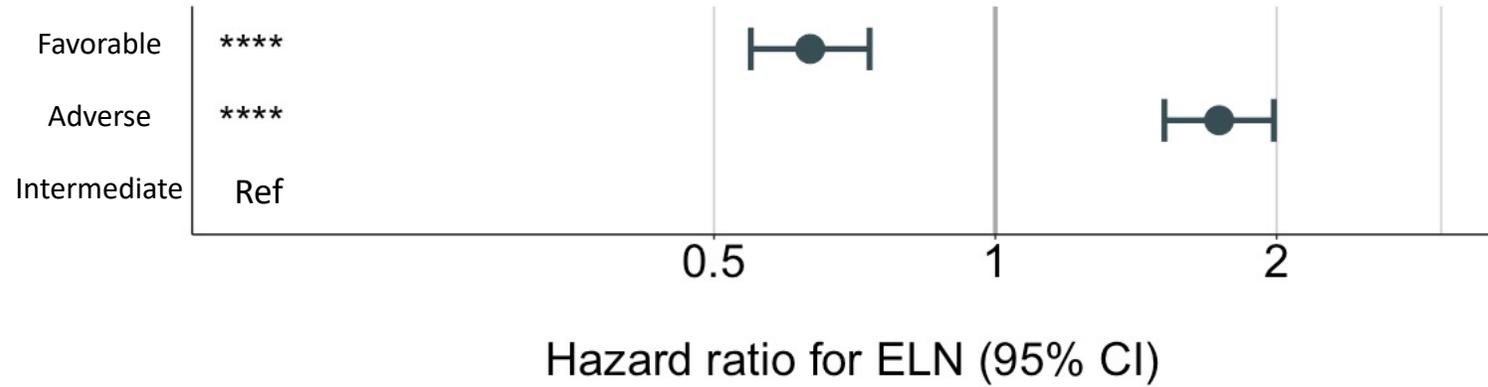

S. Figure 49: Sankey plot comparing the proportion of the ELN²⁰¹⁷ risk groups shifting in the proposed risk groups in the AML NCRI cohort (n=2,113). Sankey Plots comparing ELN and risk proposal frequencies.

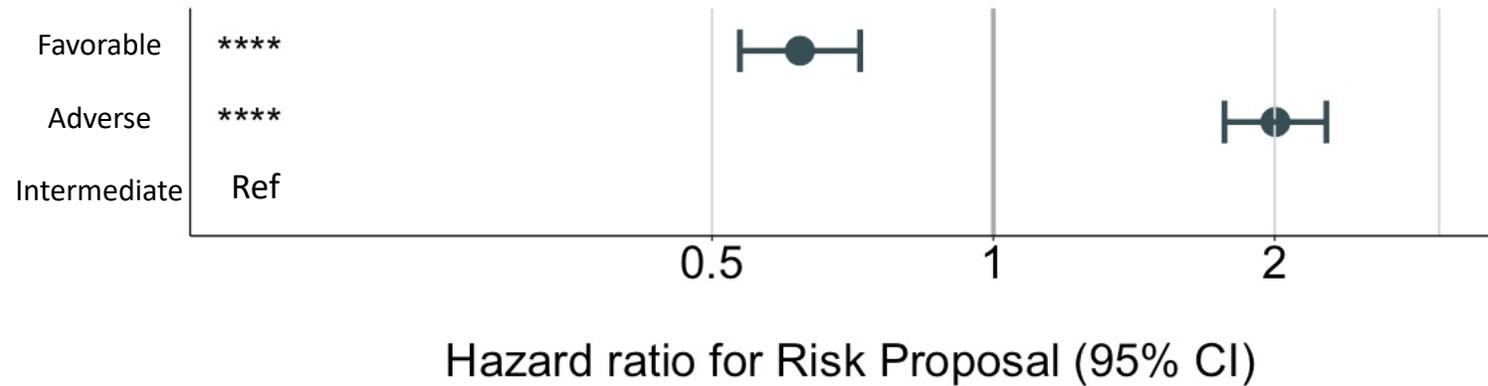

S.Figure 50: Forest plot multivariate Cox regression of A. ELN²⁰¹⁷ risk categories and B. risk proposal in NCRI trial study set (n= 2,113). Dots and lines represent estimated hazard ratios and 95% CI, respectively. **P < 0.0001, ***P < 0.001, **P < 0.01, ns, not significant. P > 0.05, Wald test.**

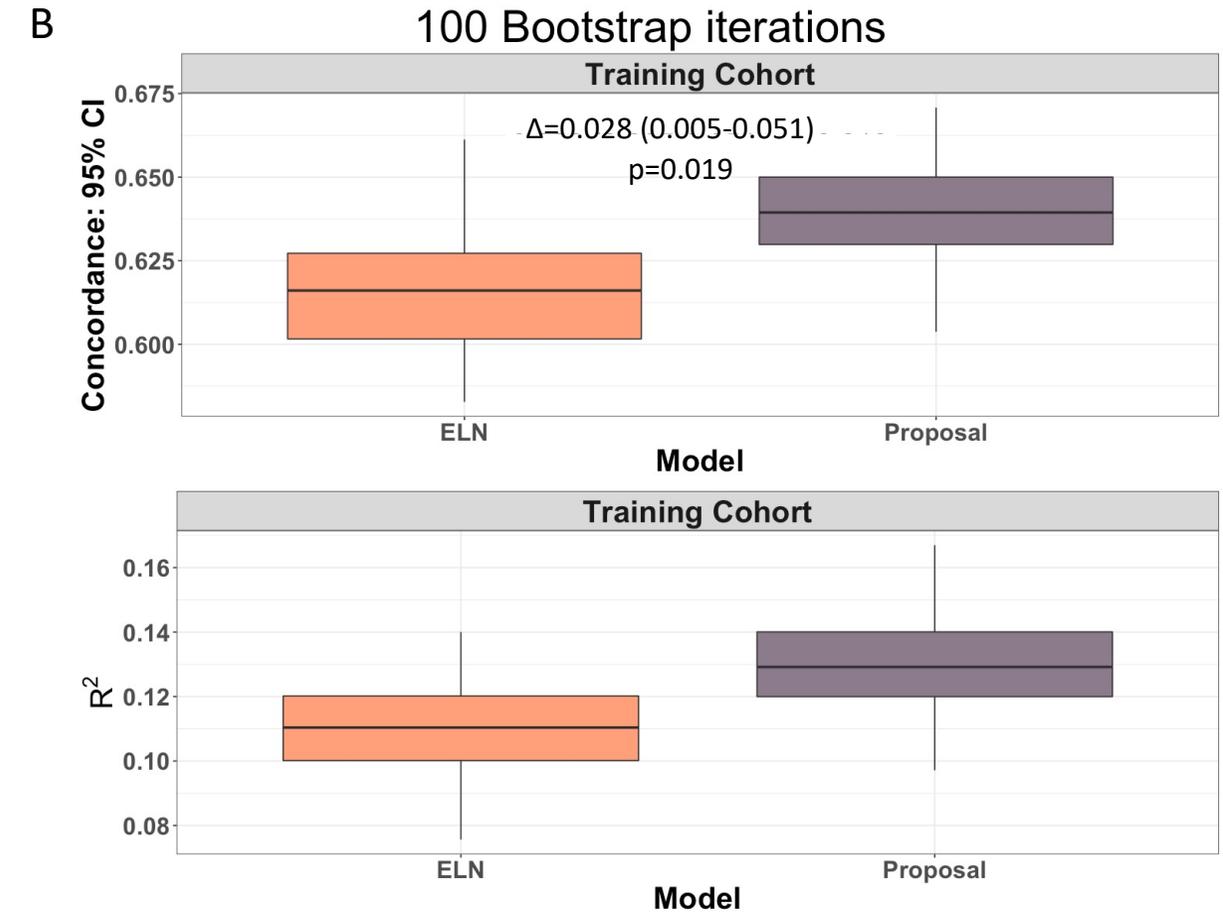

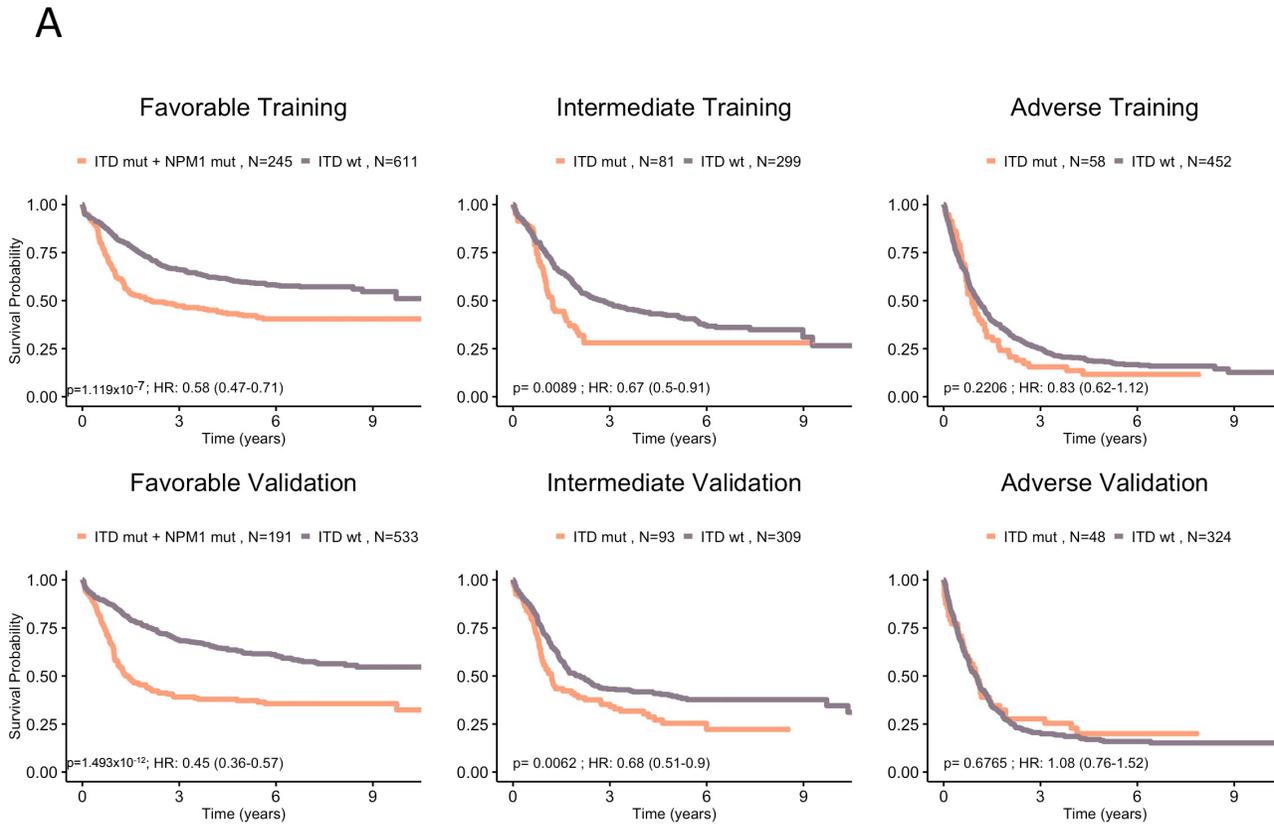

A.

B.

S. Figure 51: New risk proposal based on the AML classes on the subset of intensively treated patients in the AML NCRI cohort (n=1,755). A. Kaplan-Meier overall survival curves comparing each of the proposed risk strata (Favorable^P, Intermediate^P, Adverse^P) by FLT3^{ITD} status for the training AML NCRI cohort for intensively treated patients (n=1,755) validate the rationale for the FLT3^{ITD} shift in risk. P values were computed using two-sided log-rank test. B. The estimated improvement in the concordance index (C-index) and pseudo-variance explained (R²) for the two classifiers in the training AML NCRI Cohort (n=1,755). 95% confidence intervals were generated by bootstrap resampling for the C-index. In all boxplots, the median is indicated by the horizontal line and the first and third quartiles by the box edges. The lower and upper whiskers extend from the hinges to the smallest and largest values, respectively, no further than 1.5× interquartile range from the hinges. Annotated P values are from two-sided t score test.

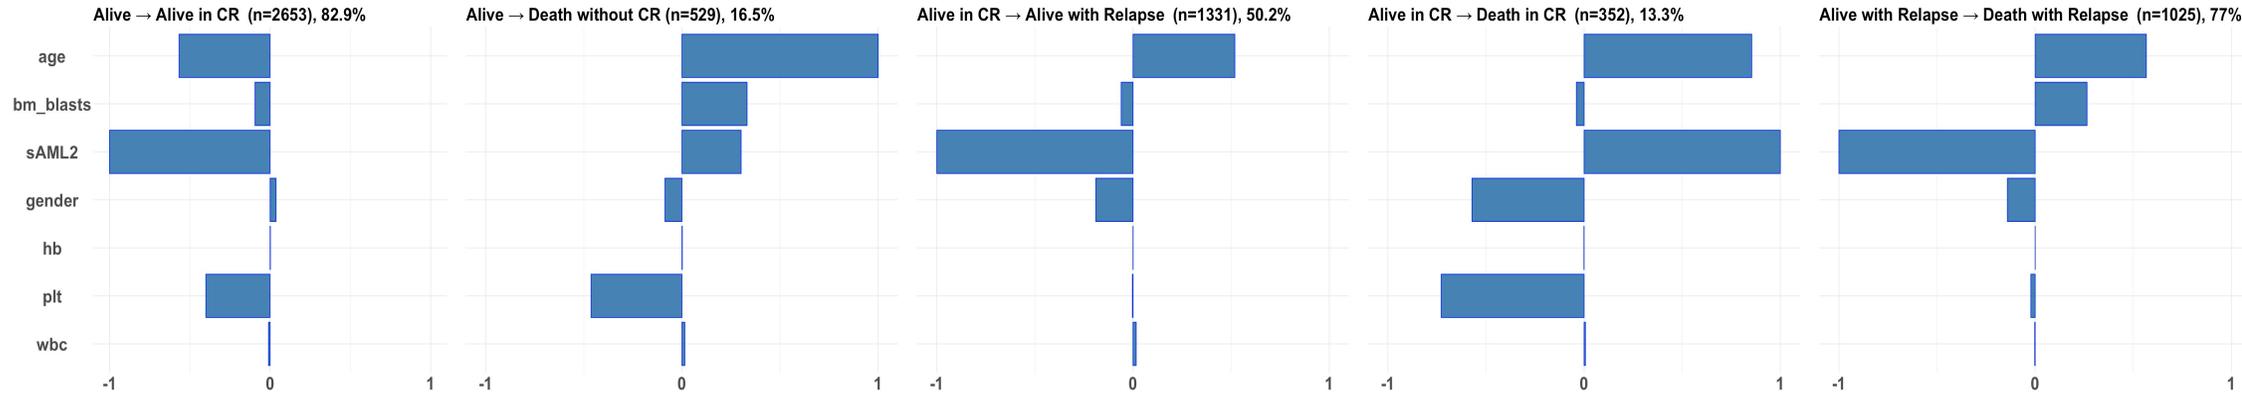

S. Figure 52: Example presentation of personalized clinical decision support tool for relative contribution of the covariates in all possible transitions.

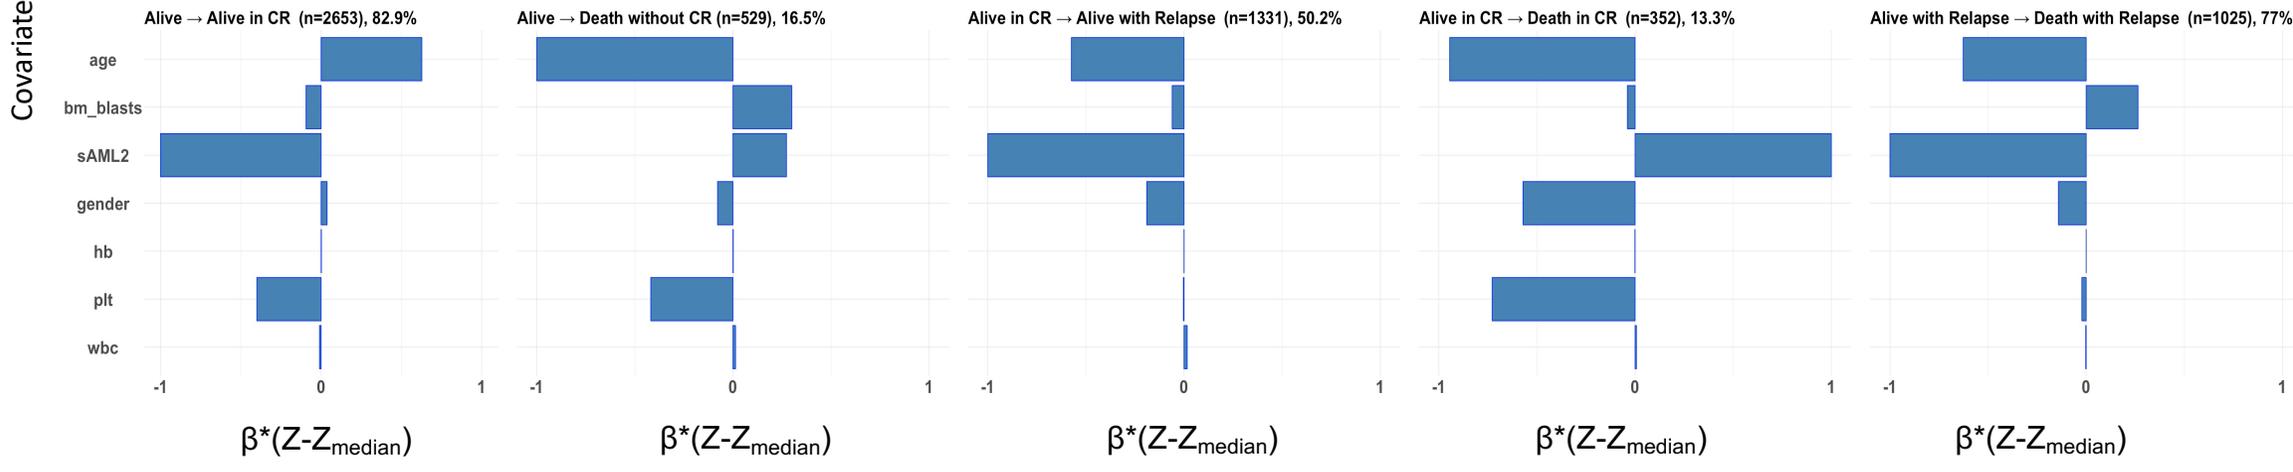

The calculator is derived using the multi-state models that consider data from (n=3,201 total patients, UK NCRI and AMLSG) all intensively treated. Input parameters to include cytogenetic, genetic, clinical and demographic are considered to display each patient's ELN²⁰¹⁷ score alongside the proposed by this study molecular class and proposed risk group. Personalized estimates on the basis of age and gender are also enabled. To contrast the contribution of the covariates, we also computed the relative contribution for a younger (40 year old) patient with the same covariates. The relative contributions correspond to the relative $\beta \cdot (Z - Z_{\text{median}})$ values where β is the coefficient derived from the multi-state Cox model for that particular transition for that specific covariate named Z and Z_{median} is that same covariate for a median patient in the combined cohort. For more details, refer to S.Appendix.

Patient Model: Genetic, Clinical & Demographic		
ELN 2017 Risk Score INTERMEDIATE	Proposed Risk Score ADVERSE	Molecular Classification sAML2
Gender: female	AML Type: Primary	Performance (ECOG): 1
Age at Diagnosis: 63 years	White Cell Count: 17.3 1e9/l	Platelet Count: 170 1e9/l
Bone Marrow Blasts: 98 %	Hemoglobin: 9.4 g/dl	Genetic Mutations: BCOR, SF3B1

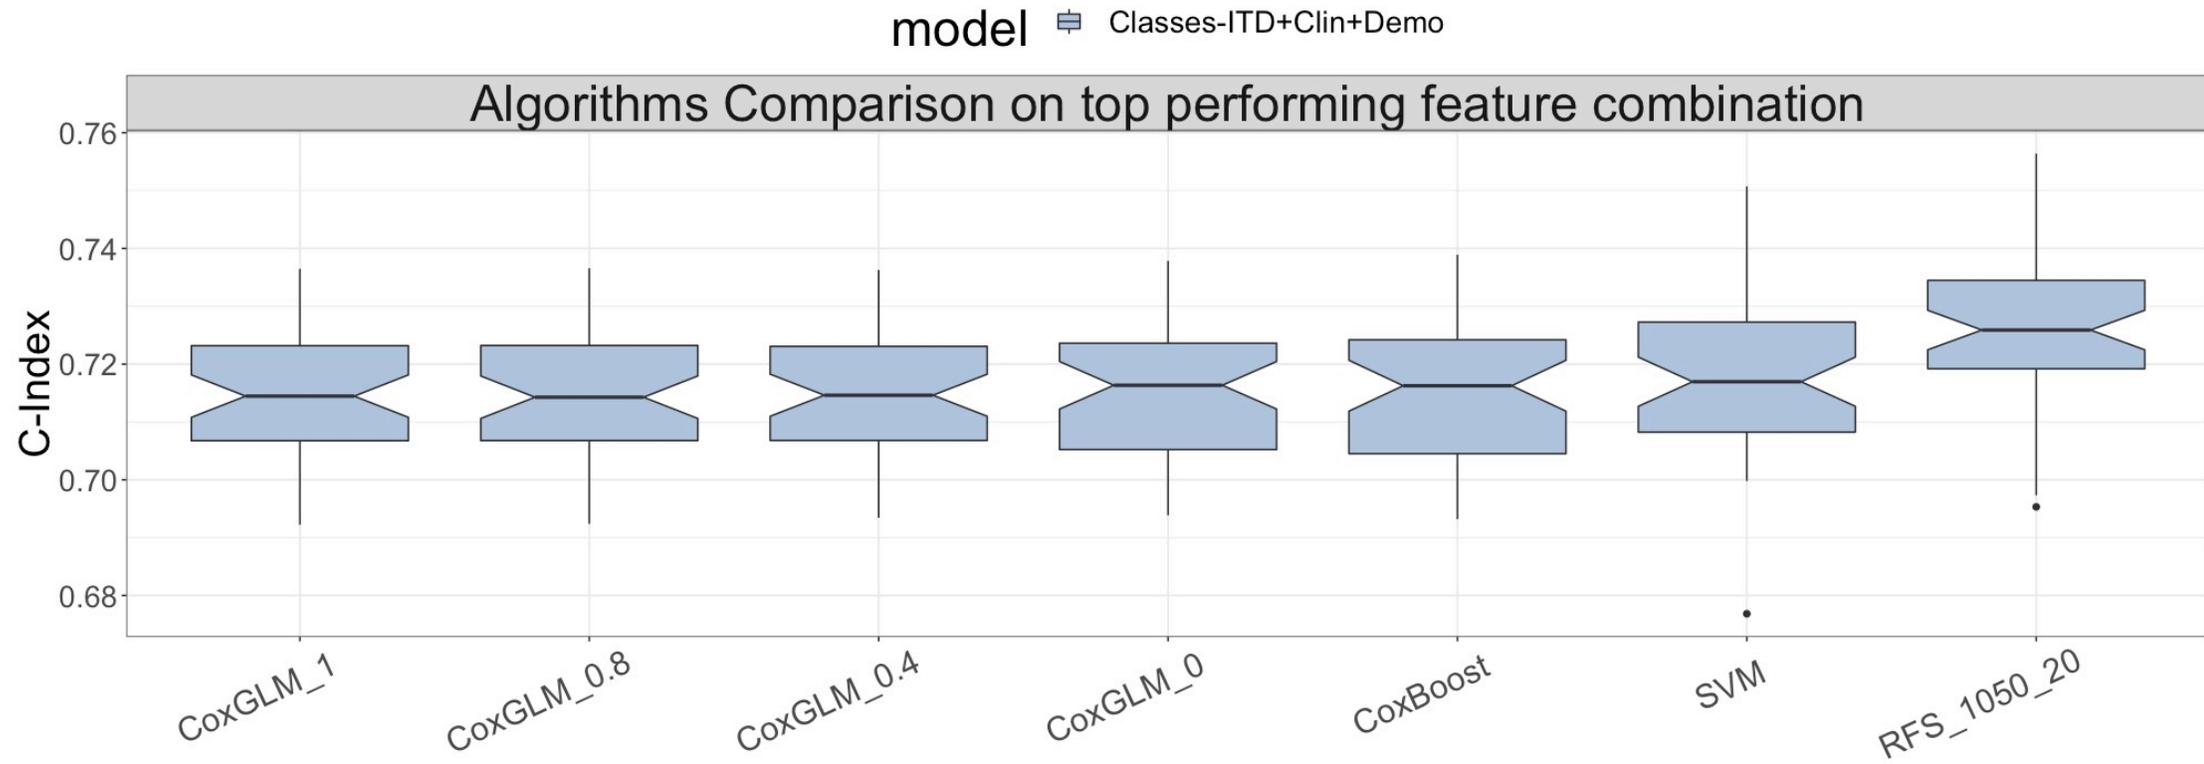

63 y old

40 y old

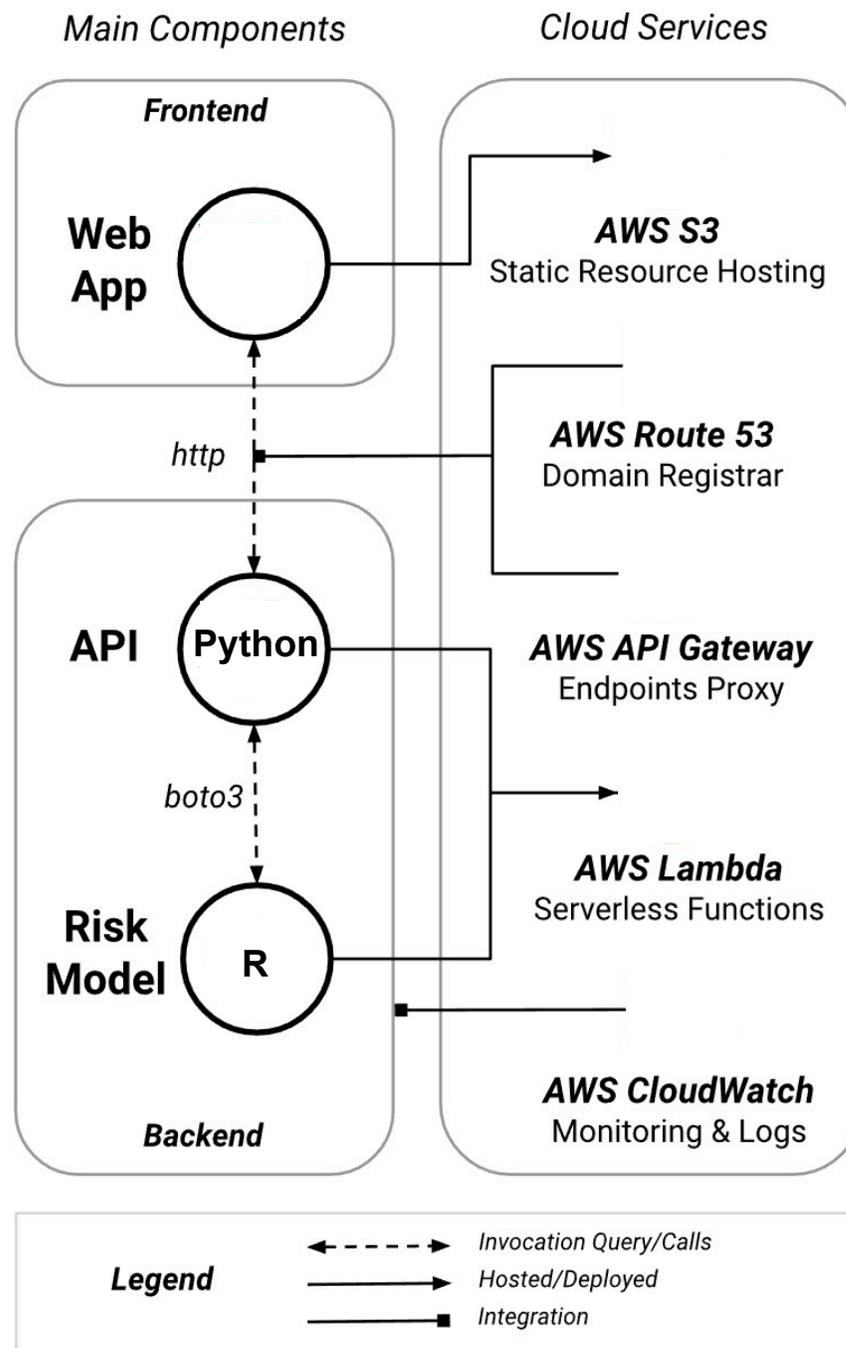

S. Figure 53: Comparison of different statical models C-index distributions (50 repetitions,N=2,113) on the top performing feature combinations. In all boxplots, the median is indicated by the horizontal line and the first and third quartiles by the box edges. The lower and upper whiskers extend from the hinges to the smallest and largest values, respectively, no further than 1.5× interquartile range from the hinges.

S.Table 9: Hyperparameter selection for BDP processes in study.

Hyperparameter names	Hyperparameter search range	BDP1	BDP2
Burnin iterations	3000 to 7000	7000	5000
Number of chains	3 to 7	3	3
Number of iterations between collected samples	20	20	20
Cosine similarity threshold	0.9	0.9	0.9
Number of posterior samples	150-1000	250	150
Initial number of clusters	3 to 30	17	5
Base distribution	Uniform dirichlet, Gaussian, binomial	Gaussian	Gaussian
Concentration parameter αA	0.1 to 100	0.5	2
Concentration parameter αB	0.1 to 100	1.5	6

Supplementary Appendix

1. Study Participants

1.1 AML NCRI Cohort (Validation)

The following AML Study Group (AML 17 NCRI) institutions and investigators participated in this study:

Dominic Culligan, M.D, Aberdeen Royal Infirmary, UK; Kiran Tawana, M.D, Addenbrookes University Hospital, UK; Ranjit Dasgupta, M.D, Arrowse Park Hospital, UK; Andres Virchis, M.D, Barnet General Hospital, UK; Mary McMullin, Prof, Belfast City Hospital, UK; Manoj Raghavan, M.D, Birmingham Heartlands Hospital, UK; Paul Cahalin, M.D, Blackpool Victoria Hospital, UK; Sam Ackroyd, M.D, Bradford Royal Infirmary, UK; Priyanka Mehta, M.D, Bristol Haematology and Oncology Centre, UK; Adam Rye, M.D, Cheltenham General Hospital, UK; Emma Welch, M.D, Chesterfield Royal Hospital, UK; Salaheddin Tueger, M.D, Countess of Chester Hospital, UK; Hannah Hunter, M.D, Derriford Hospital, UK; Atchamamba Bobbili, M.D, Doncaster Royal Infirmary, UK; Roderick Neilson, M.D, Falkirk and District Royal Hospital, UK; Earnest Heartin, M.D, Glan Clwyd Hospital, UK; Adam Rye, M.D, Gloucestershire Royal Hospital, UK; Norbert Blesing, M.D, Great Western Hospital, UK; Kavita Raj, M.D, Guys & St Thomas Hospital, UK; Jirri Pavlu, M.D, Hammersmith Hospital, UK; Richard Kaczmarek, M.D, Hillingdon Hospital, UK; Debo Ademokun, M.D, Ipswich Hospital, UK; Angela Wood, M.D, James Cook University Hospital, UK; Cesar Gomez, M.D, James Paget Hospital, UK; Paresh Vyas, M.D, John Radcliffe Hospital, UK; Jindriska Lindsay, M.D, Kent and Canterbury Hospital, UK; Mark Kwan, M.D, Kettering General hospital, UK; Ghulam Mufti, Prof, Kings College Hospital, UK; Kate Hodgson, M.D, Leicester Royal Infirmary, UK; Charlotte Kallmeyer, M.D, Lincoln County Hospital, UK; Eleni Tholouli, M.D, Manchester Royal Infirmary, UK; Maadh Aldouri, M.D, Medway Maritime Hospital, UK; Moez Dungarwalla, M.D, Milton Keynes Hospital, UK; Simon Bolam, M.D, Musgrove Park Hospital, UK; Abraham Jacob, M.D, New Cross Hospital, UK; S Tauro, M.D, Ninewells Hospital and Medical Centre, UK; Matthew Lawes, M.D, Norfolk and Norwich University Hospital, UK; Nicki Panoskaltis, M.D, Northwick Park Hospital, UK; Jenny Byrne, M.D, Nottingham University Hospital and Paediatrics, UK; Sateesh Nagumantry, M.D, Peterborough City Hospital, UK; Paul Moreton, M.D, Pinderfields Hospital, UK; Darshayani Furby, M.D, Poole Hospital, UK; Mansour Ceesay, M.D, Princess Royal Hospital, UK; Mary Ganczakowski, M.D, Queen Alexandra Hospital, Portsmouth, UK; Charles Craddock, Prof, Queen Elizabeth Hospital, Birmingham, UK; Peter Coates, M.D, Queen Elizabeth Hospital, Kings Lynn, UK; Sabia Rashid, M.D, Queen Elizabeth Hospital, Woolwich, UK; Paul Greaves, M.D, Queens Hospital, UK; Caroline Duncan, M.D, Raigmore Hospital, UK; Pratap Neelakantan, M.D, Royal Berkshire Hospital, UK; Rachel Hall, M.D, Royal Bournemouth Hospital, UK; Bryson Pottinger, M.D, Royal Cornwall Hospital, UK; Juanah Addada, M.D, Royal Derby Hospital, UK; Asim Khwaja, M.D, Royal Free Hospital, UK; Mohammad Mohsin, M.D, Royal Hallamshire Hospital, UK; Andrea Corcoz, M.D,

Royal Shrewsbury, UK; Louise Hendry, M.D, Royal Surrey Hospital, UK; Timothy Corbett, M.D, Royal Sussex County Hospital, UK; Josephine Crowe, M.D, Royal United Hospitals Bath NHS Foundation Trust, UK; Craig Taylor, M.D, Russells Hall Hospital, UK; Rowena Thomas-Dewing, M.D, Salford Royal Hospital, UK; Jonathan Cullis, M.D, Salisbury Hospital NHS Foundation, UK; Yasmin Hasan, M.D, Sandwell Hospital, UK; Unmesh Mohite, M.D, Singleton Hospital, UK; Deborah Richardson, M.D, Southampton General Hospital, UK; Gail Loudon, Southern General Hospital, New Victoria, UK; Jamie Cavenagh, St Bartholomew's Hospital, UK; Dr Richard Kelly, St James University Hospital, UK; Jamie Wilson, M.D, St Richard's Hospital, UK; Srinivas Pillai, M.D, Stafford Hospital, UK; Helen Eagleton, M.D, Stoke Mandeville Hospital, UK; Shikha Chattree, M.D, Sunderland Royal Hospital, UK; Marc Drummond, M.D, The Beatson WOS Cancer Centre, UK; Mike Dennis, M.D, The Christie NHS Foundation Trust, UK; Arpad Toth, M.D, The Royal Liverpool Hospital, UK; Mark Ethell, M.D, The Royal Marsden Hospital, UK; Gail Jones, M.D, The Royal Victoria Infirmary Freeman Hospital, UK; Deborah Turner, M.D, Torbay District General Hospital, UK; Asim Khwaja, Prof, University College London Hospitals, UK; Vikram Singh, M.D, University Hospital Aintree, UK; Julie Gillies, M.D, University Hospital Ayr, UK; Beth Harrison, M.D, University Hospital Coventry, Walsgrave, UK; William Gordon, M.D, University Hospital Crosshouse, UK; Naheed Mir, M.D, University Hospital Lewisham, UK; Srinivas Pillai, M.D, University Hospital of North Staffordshire, UK; Maria Szubert, M.D, University Hospital of North Tees and Hartlepool, UK; Jonathan Kell, M.D, University Hospital of Wales, UK; Kerri Davidson, M.D, Victoria Hospital, NHS Fife, UK; Toby Nicholson, M.D, Whiston Hospital, UK; Salim Shafeek, M.D, Worcestershire Royal Hospital, UK; Lee Bond, M.D, York Hospital, UK; Ernest Heartin, M.D, Ysbyty Gwynedd Hospital, UK; Ruth Spearing, M.D, Christchurch Hospital, New Zealand; John Carter, M.D, Wellington Hospital, New Zealand; Marianne Tong Severinsen, M.D, Aalborg University Hospital, Denmark; Ingolf Mølle, M.D, Aarhus University Hospital, Denmark; Ulrik Malthe Overgaard, M.D, Herlev Hospital, Denmark; Claus Werenberg Marcher, M.D, Odense Hospital, Denmark; Ulrik Malthe Overgaard, M.D, Rigshospitalet, Denmark

1.2 AML SG Study Contributors

The following AML Study Group (AMLSG) institutions and investigators participated in this study:

Peter Brossart, M.D., Universitätsklinikum Bonn, Bonn Germany; Bernd Hertenstein M.D., Henrike Thomssen M.D., Klinikum Bremen-Mitte, Bremen, Germany; Rainer Haas M.D., Andrea Kuendgen M.D., Universitätsklinikum Düsseldorf, Düsseldorf, Germany; Peter Reimer M.D., Mohammed Wattad M.D., Kliniken Essen Süd, Ev. Krankenhaus Essen-Werden gGmbH, Essen, Germany; Carsten Schwaenen M.D., Klinikum Esslingen, Esslingen, Germany; Hans Günter Derigs M.D., Klinikum Frankfurt-Höchst GmbH, Frankfurt, Germany; Michael Lübbert M.D., Universitätsklinikum Freiburg, Freiburg, Germany; Alexander Burchardt M.D., Matthias Rummel M.D., Universitätsklinikum Gießen, Gießen, Germany; Volker Runde M.D., Wilhelm-Anton-Hospital, Goch, Germany; Gerald Wulf M.D., Lorenz Trümper M.D., Universitätsklinikum Göttingen, Göttingen, Germany; Walter Fiedler M.D., Universitätsklinikum Hamburg-Eppendorf, Hamburg, Germany; Hans Salwender M.D., Asklepios Klinik Altona, Hamburg, Germany; Elisabeth Lange M.D., Evangelisches Krankenhaus

Hamm, Hamm, Germany; Andrea Sendler M.D., Klinikum Hanau, Hanau, Germany; Arnold Ganser M.D., Jürgen Krauter, M.D., Brigitte Schlegelberger M.D., Medizinische Hochschule Hannover, Hannover, Germany; Hartmut Kirchner M.D. KRH Klinikum Siloah, Hannover, Germany; Uwe Martens M.D., SLK-Kliniken GmbH Heilbronn, Heilbronn, Germany; Michael Pfreundschuh M.D., Gerhard Held M.D., Universitätsklinikum des Saarlandes, Homburg, Germany; David Nachbaur M.D., Günter Gastl M.D., Universitätsklinikum Innsbruck, Innsbruck, Austria; Mark Ringhoffer M.D., Martin Bentz M.D., Städtisches Klinikum Karlsruhe gGmbH, 4 Karlsruhe, Germany; Heinz A. Horst M.D., Michael Kneba M.D., Universitätsklinikum Schleswig-Holstein–Campus Kiel, Kiel, Germany; Stephan Kremers M.D., Caritas-Krankenhaus Lebach, Lebach, Germany; Andreas Petzer M.D., Krankenhaus der Barmherzigen Schwestern Linz, Linz, Austria; Gerhard Heil M.D., Klinikum Lüdenscheid, Lüdenscheid, Germany; Thomas Kindler M.D., Matthias Theobald M.D., Universitätsklinikum Mainz, Mainz, Germany; Katharina Götze M.D., Christian Peschel M.D., Klinikum rechts der Isar der Technischen Universität München, München, Germany; Sabine Struve M.D. Klinikum Schwabing, München, Germany; Peter Schmidt M.D., Städtisches Klinikum Neunkirchen, Neunkirchen, Germany; Ali-Nuri Hünerlitürkoglu M.D., Lukaskrankenhaus GmbH Neuss, Neuss; Germany; Claus-Henning Köhne M.D., Klinikum Oldenburg, Oldenburg, Germany; Axel Matzdorff M.D., Caritas-Klinik St. Theresia, Saarbrücken, Germany; Richard Greil M.D., Gudrun Russ M.D., Universitätsklinikum der Paracelsus Medizinischen Universität Salzburg, Salzburg, Austria; Jochen Greiner M.D., Diakonie-Klinikum Stuttgart, Stuttgart, Germany; Heinz Kirchen M.D., Krankenhaus der Barmherzigen Brüder, Trier, Germany; Hans-Gernot Biedermann M.D., Kreisklinik Trostberg, Trostberg, Germany; Helmut Salih M.D., Lothar Kanz M.D., Universitätsklinikum Tübingen, Tübingen, Germany; Hartmut Döhner M.D., Konstanze Döhner M.D., Richard F. Schlenk M.D, Universitätsklinikum Ulm, Ulm, Germany; Wolfgang Brugger M.D., Schwarzwald-Baar Klinikum Villingen-Schwenningen GmbH, Villingen-Schwenningen, Germany; Elisabeth Koller M.D., Hanuschkrankenhaus, Wien, Austria; Aruna Raghavachar M.D., Helios-Klinikum Wuppertal, Wuppertal, Germany.
